Jim Johnson asked:

> By the tone of your message, is it safe to assume you don't work for ICD
> these days?

I haven't worked for ICD for over a year now. Sometimes it seems a lot
longer, but sometimes it seems like yesterday.

> I seem to recall that you are the programmer that wrote the patch to allow
> AtariWriter Plus to run under SDX. Nice piece of coding.

Not me! Mike did all the SDX coding. I documented and tested everything,
but I didn't write any of it.

> What are you up to these days?

Boring systems analyst stuff for another platform. I've gotten pretty
good at making Windows behave.
I'm still doing the 8 bit RT on GEnie, though.

In response to Stephen Preston's inquiry RE: moving files from a DEC machine to the Classic Atari, there are 2 programs that will do it. One is OmniCom, which is basically a VT-100 emulator with Xmodem & KERMIT protocols. I never could get OmniCom to work, & besides the software-generated 80-column display is rather crummy.

The 2nd- & my preferred- is John Dunning's KERMIT-65 v3.7. I got it off of GEnie. Very nice 80-column screen. The KERMIT protocol is a tad slow but 100% reliable. It's compatible with SpartaDOS & RAMdisks- the latter helps speed things up a bit. I use it all the time for moving files back & forth between my employer's DEC VAX/VMS mainframe & my Atari, never a problem. Compatible with REV 4 P:R:C & Black Box, I think the 850 also. NOT compatible with P:R:C REV 3! (ICD's fault, not Dunning's.) I use 2400 baud, no sweat, works fine.

Ok... as for the HARDware "limitations" of the Atari 8bit, you can do all
of the following with help from hardware interfaces:

Connect IBM keyboards
Connect IBM (RS232) modems - up to 19.2k baud
Connect IBM (SCSI) hard drives - up to 130meg online at once
COnnect IBM floppy drives
Install your motherboard in an IBM PC case (good with the keybd)
Run your 8bit (this is a hack and a half!) as a "laptop" or
in your car (has anyone actually INTERFACED the car to
the computer.. like odometer or speedometer or anything)

oops..gotta run!

those are a few of the more imp
impressing things! :0

What GOOD sports games are there for the Ataris?

The only sports games I've ever really played are things like "Soccer" (from Sears.. aka "Pele's Soccer") for the 2600, SteepleChase (was that ever an "Atari" release? It's the other Sears game I have) for the 2600 as well, and some NICE (but old) Wrestling game for the Nintendo and I think I tried some Football game for Nintendo.

The only GOOD (;)) sports game I played was a nicely done Soccer game for the PC that my friend had (even though it was EGA or something! :))

Just wondering, but did anyone ever do anything useful with this language?
I remember playing around with it quite a bit, but never anything beyond
the occasional graphics demo...[e.g. on the Logo type of Graphics demo, little
shapes and the what-not]. I also remembering finding a much easier time
of the whole thing, when Atari Logo did finally come out... so out side
of educational means was there much that could be done with it?

I ask this, because I just realized that Pilot is available for other
computers, and have a version running as we speak of it for 32-bit OS/2 on
a PC. Anyways, just some thoughts would be appreciated... or some sample
source to try again maybe - or, is everyone like me, and can't think of
a application that Pilot would be a prime choice for? :)

Also, of course at the time there were rumblings and mumblings of a
Pilot II cart? If indeed it was a different project than Atari Logo, what
features would this second version of Pilot of added? Maybe, I'm being
cynical, but there seems a limit as to how far this language could have been
taken to...

[I'm not looking forward to extracting the source off of the old cassettes
that came with the Atari Pilot package... egads.:)]

No, I get the QWK packets right from the system I call. I run a program
called "UQWK" now in version 1.7, to toss QWK packets from my school system.
Really works great, lets you set up the .newsrc file the way you want and
packages all news lead as well as E-mail. Then takes the REP packet and posts
the mail to the news leads and sends off the E-mail.

The C sources for UQWK can be found at ftp.gte.com under /pub/uqwk as
uqwk1.7.tar.Z put your information in to the spaces provided in uqwk.h and
compile it on the system you plan to run it from. Gets you on and off quick
if you only have a limited time on your system.

Hope it helps.

ISTR that Action on an Atari was used by Russ Wetmore to write some integrated WP/Databse/Comms package. This was then ported to the C64 using Action. Presumably Action was used for the processing core and then something native to the C64 for the graphics.

Hello all!

I'm in the middle of creating a PC/VGA version of Drol. I have a copy of
the original on an Atari diskette. I also have an 800XL with a 1050 and
the OmniMonXL ROM replacement. Gosh, I wish I could remember how to use
all this stuff!

Is it possible to read an Atari diskette on a PC? If so, how? If not,
what's the easiest way to transfer data from the Atari to the PC?

Also, I'll pay big money for OmnimonXL and Drol documentation.

> > What GOOD sports games are there for the Ataris?
>
> Probably the best sports game that I have played on the 8bit
> Atari is All Star Baseball. It will play on all the 8bits
> that have 48K.

I think that is "GameStar Baseball" aka "Star League Baseball";
there was also "StarBowl Football".

I think the same people went on to Accolade (I might be wrong; I'm
thinking of Bob Whitehead who went from Atari to Activision to
Accolade.. was GameStar another?) and made Hardball... This puts
GS Baseball to shame.

That was released as a disk, and as a cartridge by Atari for the
XEGS. This gave a perspective view, and let you act as a manager
for your team.

Atari had a Tennis cartridge, also a Football and Soccer cart.
I've played Tennis... not bad.

Imagic produced (and EA distribted) Touchdown Football. I can't
judge.. but I'll say I was bored.

Thorn-EMI had a Soccer cartridge.. got raves when it was released.
The screen scrolled and look sort of 3D.

There were any number of racing games.

3080. Atari 8-bit items for sale

The following "stuff" (hardware, software, books) will be sold to best
(reasonable) offer. Please pick up any items you are interested in,
there is NO need to buy everything!
Please e-mail offers to COHEN@BORN.PHYS.VIRGINIA.EDU , or call (804)293-8973
late evenings in case you have no e-mail account (prefer e-mail, please).
I will respond to every e-mail message I get here (if you get no response,
please try again). PLEASE FEEL FREE to make any offer (we can then discuss it)!
I intend to finalize
sales within a few days, and will accept immediately offers that look very good
(if there will be any).

Thanks!

***** HARDWARE *****

Except where otherwise notes explicitely, all hardware was in working condition
when used last (I no longer have the Atari computer to test it now).
When problems are known to exist, details are given.

Printer- Gemini-10X (Centronics parallel standard interface, for use with Atari
850 unit and parallel cable sold below or equivalent)
Monitor-

MAGNAVOX RGB- MONITOR 80, with
Composite AND RGB CGA, both color and green monochrome modes.
The model # is CM8562 074G.
This monitor has composite color input, Audio input, RGB TTL (CGA video) input,
CVBS/VCR button, and is dual mode color/green monochrome push-button switchable.
This is useful for VCR, computers with composite output, CGA as well.
Good for 80-column applications.
(I believe that the C=128 has CGA color video output plus audio, and could use
this monitor in the RGB mode, and audio).

More hardware items-

Atari CX853 16K RAM memory module for Atari 800
Axlon RAM CRAM 32K memory module for Atari 800
Modem cable (to any RS232 modem) for Atari 850 unit
Parallel (centronics) printer cable for Atari 850 unit
MPP CARD?/AT centronics parallel printer interface (hooks up a standard parallel
printer to Atari I/O port, no need for 850 unit).
Atari power supply model # C061982 (for the XL/XE series I think).
Atari 1027 Letter Quality printer almost new, in original box, with manual,
but does not work properly
Atari 1020 color printer/ plotter with manual.
Another Atari 1020 Color Printer/plotter with manual, this one need work

on print spool
Atari paddles
Joysticks- various types and shapes, all tested and working well.
Atari 1030 Modem with manual
Taihaho Direct Connect 300/450 baud modem model TH-003 autodial/auto answer
(I think this connects to the joystick port)
Atari 410 Program Recorder (the original one).
Atari 1010 Program Recorder - I have 2 units, Work fine.
Atari 1010 Program Recorder - save: ok, load: no.

4 DISK DRIVES-
2 Atari 1050 drives, 2 Atari 810 drives, all sold as is.
They had various levels of problems, the 1050 spins and the light comes up
but it won't load, and one 1050 and one of the 810 were dead as I recall.

***** SOFTWARE *****

Cartridges-
==========

Asteroids
Pac-Man
Space Invaders
BASIC (CXL4002) with manual

Disks- (All are original disks)
======
TimeWise with manual and original box
Epyx Summer Games with manual and original box
Strategic Simulations Inc. Computer Baseball with manual and original box
Sargon II with manual and orginal box
Music Construction set with original binder and manual
Pinball Construction set with original binder and manual
Infocom Zork I with manual and original box
Micro League Baseball with manual and original box
Micro League Baseball General Manager/Owners Disk with original box
Atari Translator
Ghostbuster by Activision
CONAN (Datasoft)
Computer Baseball
Atari program Exchange (APX) ATSPEL/AT.WRIT.-program 1.0, by R.S. Kistler
Atari program Exchange (APX) ATSPEL/AT.WRIT.-dictionary 1.0, by R.S. Kistler
Atari DOS 2.5 with manual

plus about 100 generic disks with shareware, and many types of programs
(word processors, terminal emulators, utilities of all sorts, games, etc.)

Cassettes-
==========

Joystick Sketchpad with manual (new, sealed)
apx Eastern Front 1941 (with manual and original box)
Thorn EMI Compute 4 and Reversi (in original box with instructions)

Thorn EMI Snooker and Billiards (in original box with instructions)
Atari Statistics I (with manual and original box)
Atari States and Capitals (CX4112)
Atari Hangman (CX4108)

Books-
======

Bill Carris- Inside Atari BASIC
ICD SpartaDOS Construction Set
Your Atari Computer
Computers for Kids- Atari edition
Albrecht, Finkel and Brown- Atari BASIC- XL Edition

Please e-mail offers to COHEN@BORN.PHYS.VIRGINIA.EDU , or call (804)293-8973

>
I had plans to do something like this with the extra RAM in my 800XL years ago, back when I liked to break copy protection for fun. The plan was to boot a program which would tap into the SIO interface in the OS, and monitor all transactions, and keep a list of sector reads that were good and those that were bad. I would then call the reboot vector and boot the protected game, and monitor the load. Finally, I would push the help key (which my modified OS would look for), and reboot back into BASIC. I could then load a BASIC program to dump the memory in the 800XL shadow RAM, and write a special SIO interface for the game that didn't require a special disk. My special SIO would return the values the games loader looked for.

I never got around to doing this, though...

> My end goal is to build something that can:

You are quite ambitious. However, this would be "way cool". I think item number 1 is the most important, however.

You also mentioned earlier in you post about reading in cassettes. I don't think that will work over RS-232, but I can't remember why. It's just a gut feeling I have. Of course, I have been wrong before, back in 1986, or was it 1987? :-)

Wierd :) Wants an 800 when he @an get an XL/XE? :) Must be nostalgia
;)

I'd like to re<ommend the following (along with the 800, if you just need
an Atari, nothing spe<ial):

1200xl hard to find best keyboard XL <ompat.
no PBI

800xl good keyboard XL <ompat. PBI

65xe umm.. :) XL <ompat. PBI
or 130xe (130xe has 128k)

> it? Grin...

Results: When the independent strings are printed to disk, I get a
10-byte (that is to say, 10 space) pad in front of each string. No
UUDecoder will recognize the file, except of course if you make the BASIC
one do it, in which case the BASIC UUDecoder will still insert a Crtl-M
instead of a carriage return.

Speaking of TBXL/E... Is there a version of either that supports calls to
the R: device?

Perhaps because of the existence of rec.music.makers.synth? That's where I post all my ST MIDI questions, as do most netted ST MIDI folks.

I don't share the original poster's zeal, but he's got a point. An ST emulator that doesn't do MIDI is kind of like a Mac emulator that doesn't do DTP.

3088. Subject: Y-Modem-G

Are there any term programs for the Atari 8bit that supports Y-modem-G?
How hard would it be to make one for BobTerm? Unlike Zmodem, Y-Modem-G should
be easy, right?

I'll "third" that motion. :) The ST was and is a MIDI machine. If GEMulator
can't do MIDI, then it is ignoring a sector of the market that both spends a
lot of money on Atari hardware and software, but also is probably eager to
purchase something like the GEMulator.

(Hopefully Darek will remember that Atari has always advertised the ST, and
now the Falcon, in the music industry first and foremost... we have more
Falcon dealers who are music stores than computer stores where I live...)

See if you can get a copy of "UMODEM", the CP/M version of XMODEM for the VAX, or better still, the VAXMODEM/VMODEM VAX update of CP/M XMODEM written explicitly for VAX hardware. Or, more current, I believe that the DSZ, X/Y/ZMODEM package of core routines might have a version of "MAKE" for installation on a VAX running VAX C.
(Unfortunately I am not on a VAX.... :-( )

P.S. To: ALL,

What is "The Dreadnaught Factor" ? That name sounds vaguely familiar....

Textpro will do that. I have used it to write some fairly large files
in segments and then merge them. This is a great all around editor, and
there is no end to the wonders you can do with its macro frature.

BTW, I understand there have been several revesions since the version I have,
where could I get an up to date version? If it's downloaded from somewhere,
I need to be walked through this, I haven't done that before.

> +------------------+----------------------------+--------------------------

My god! :) You're going to try to remake a game JUST BY TRANSFERING
FILES TO THE PC!? What will you do with it then? I mean, it's going to
be TOUGH! When you write a game, you need to know a lot of stuff (unless
you're improvising, like I used to do a LOT :))... You need the "rules"
of the game. How the enemies and stuff react to different things, and
when/where the come, etc.etc.etc.! If it's just going to be a Drol
"look-alike", then if you know how to program, get at it. If you're
planning on taking the actual game code and reproducing it exactly on the
IBM, have fun!

I mean.. every system has its own quirk/funny things to use... Like the
Atari and the DLIs and VBIs and player missles and all sorts of other
tricks!!! :)

Have fun, though! :) (Now that I'm a better programmer, maybe I'll go
back and reproduce all of my 2600 games on my XL like I always wanted to!
:) :) :))

Drol is a very STRANGE game where you're a Space-man looking guy going
around avoiding big gorillas, snakes, etc (depends on the level), and
cutlery hehe and trying to save a family... its weird.
My bro had the C=64 ver.

AAAAAAAAAAAAAAAAAAAAAAAGGGGGGGGGGHHHHHHHHHHH!!!!!!!!!!!!!!!!!!!!
D'OH! OOPS! I bet there was a

print #1,a$

it should be:

print #1;a$
-
-
-
-
-

I got so used to Qbasic's idiot "Expected: ',' " error when I did the
more NORMAL ";" in the print commands that I typed "," that time! SORRY!
OOPS!

THAT should SUPPOSEDLY fix it.. I hope! :)

1) I haven't seen a R:handling TBXL YET! Not even using that supposed
"fix all" patch that came with that M:ouse handler on the _AC_ disk#1.
2) What's the diff. between TBXL and TBXE? Where IS TBXE? Thanx! :)
3) Does FrOst BASIC have ALL of the same commands and same tokenization
as TBXL? It would be nice if once in a while I could use a GOOD,
but still simple-as-hell language like TBXL (or FrOst) with the modem.
(FrOst works on the 800s, unlike TBXL, and I suppose it also works
with disk-based SpartaDOS, unlike TBXL ... ???? !!!)

So!? Who out there has/has used FrOst BASIC? Other than the lack of
RAM, does it do all that TBXL does? Any bugs to point out?

Finally... the RunTime package for TBXL takes up the same area that TBXL
itself does, doesn't it? The "under-the-OS" RAM? If not, then simply
compiling a program written to use the R: handler SHOULD work with TBXL
when compiled... then again, maybe not.

Also, FINALLY finally (I promise! :)), who out there has had strange
things happen when using arrays and/or very big or small floating point
numbers? (like 0.12446748874742727363, for example.. ok, that's an
exaggeration.. more like 0.1244674887)

>
> Simon.

I don't think I have.. unless you made that M: handler on the _AC_ disk #1... I SORT of like the M: handler a lot, but I'd like it more if it didn't use player/missle graphics. I sometimes would rather use my own graphics (depending on the screen mode) to do mouse-pointer-ing.

Speaking of M:, has anyone made any software using it? It IS a nifty idea, it works just like R: would. Take BobTerm, for example. It's a term program. It talks to the modem. It doesn't care WHAT type of modem/interface/whatever you have (via SIO, via 850, via P:R:C., via stick ports, etc.), because IT just talks to the R: handler.

Where does the R: handler come from? From YOU. Depending on what HARDWARE you use, you simply copy a R: handler installer onto your BobTerm disk or wherever and replace your "old" (if you upgrade or whatever) RS232.COM file. As for the 850, it doesn't even NEED an RS232.COM, does it?! I dont know how 850's work! :)

3101. Flicker Term

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-25 19:50:04 UTC
From: anyone@cyberden.sf.ca.us
Message-ID: <6Xsu9B6w165w@cyberden.sf.ca.us>
Source record: 105372

There's supposedly a new Terminal program being written for our little Classics called "FlickerTerm". Does anyone have any info on it?

Would anyone LIKE any info on it? (I'll be checking out about it again soon I hope - been reading tidbits about it on the BBS Express! nets, but I dont call the BBSEx! boards I do too often cuz I'm not "college-boy" and cant spend $$:))

It SOUNDS, just from the name, like it MIGHT use that idea I TRIED to convince you people would be nice... for 80 columns simply use two Graphics 0 screens with a 3 x 8 font (scrolled every other "flicker") or two (just swapped.. it'd be a waste of 1k, though if you had two fonts which were identical except moved over 1 nybble.)

Anyways.. is this what it is? An 80 column term using 2k instead of 8? :) I hope so.. that'll mean somebody either listened to my idea or reinvented it. (like how I invented the idea of wind-powered electric back when I was a little kid.. just to find out later that it already exsisted! :) hehe)

Mike Todd recently posted that he'd like to pull BASIC out of his machine and replace it with something better.

Mike, why not do just that? Bob Puff aka CSS and several other vendors currently sell ROM replacements for very minimal $$'s.

3106. Dreadnaught factor -- it's a game

That's the name of a game for the Atari Classics that involves
flying a small spacecraft over giant star cruiser things, and bombing
them until they blow up. It's kinda fun.

From: timuszyn@jupiter.cse.utoledo.edu
Message-ID: <1993Aug25.163254.5594@uoft02.utoledo.edu>
Source record: 105362

Help: trying to get some info on the old C.S.S. black box and "packet o' fun kit"... you know, the floppy drive controller, HD controller, printer spooler, etc. all in one? You could read and write IBM 360k formats, etc. etc. etc...

The company doesn't seem to exist anymore. Has anyone used this 'box? Was it worth the money? (Only about $200 at the time... relatively cheap!)

How about ... uhh... Happy Systems (something like that)? Anyone have an address, phone number, anything on them? They put out the modification kits for the old 810's and 1050's for speed copying/cracking/hacking...

What about the N.S.S. (??) speed enhancer for the old 800? Basically a Weitek of the old days... improved floating point, etc... made it run about 3.5 times faster.

-me

PS: Anyone SELLING something related to the above?

From: chase@electron.rutgers.edu
Message-ID: <Aug.25.19.05.54.1993.12666@electron.rutgers.edu>
Source record: 105365

I just got Nick Kennedy's SIO2PC kit in the mail today, so having a
little bit of time, I decided to assemble it. Well, the instructions
were clear except on one point. Which end is which on the diode.
The one I have has a silver end (small band at one end of the diode).
Which end is that.

I flipped a coin, wired it up, and find that one of the pins is
at the wrong voltage (-9v went it should be +9v). I am thinking of
flipping the diode around, but thought I would seek net wisdom before
doing so.

3111. UnZIP/UnLZH programs?

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-25 23:14:51 UTC
From: nickd@vpnet.chi.il.us
Message-ID: <1993Aug25.231451.17042@vpnet.chi.il.us>
Source record: 105376

While I was working I had little time to read news, and I've only been out of work for a couple of weeks, so please excuse me if my question has been answered recently. My user group's 8-bit Librarian left a message on our BBS recently, wondering if there were any 8-bit (Atari) programs that can uncompress .ZIP and/or .LZH files. I remember an "unauthorized" version of an unLZH program that Bob Puff was working on floating around a while back, but when the word came (in this newsgroup as I recall) that Mr. Puff did not want this program distributed, and I saw it show up on our BBS, I asked that it be deleted (and it was). Was this program ever finished and released? How about an unZIP program? (Pointers to files on a.a.u.e are always welcome - with [effectively] only BART access, I'm not often up to date on what's up there, esp. lately.)

Svance,

Spartados X was full of bugs... let me see if I can find my old flame
letter to Sparta demanding a refund. Timing problems, etc... loads of
fun with drives that could switch densities... loved to ignore them!
SpartaDos 2.3 ACTUALLY worked better than X but was incompatible with
the 800 and had a few other problems. X had a better selection of
included utilities, but introduced NEW and IMPROVED bugs into the world!

Is ICD in business anymore? What's their number? I'd like to see if
they ever addressed some of the problems I documented. X had some
INCREDIBLE potential if they fixed it... kinda like Microsoft... what
was the comment in a major PC magazine a while back... Microsoft's
good for shit until version 3.something. I'd tend to agree.

Anyone still selling ICD stuff? M I/O boxes? etc.?

In answer to some of your questions:

* AIM is really not around. The subscriptions were cut in half, the mag size was cut in half. There was a Fall 1992. The last was Mar/Apr 93. There have occasionally been DOMs sent. I heard a rumor of a May/Jun 93 issue, but haven't seen it.

* AtariUser got sold. There was a rumor of a March issue, for which our Atari Group paid, but still no issue from the new owners(Ala Atari Advantage).

* Current Notes is still around, though a little smaller.

* It was the AGDA group producing "Maze of Agdagon". It is in Beta Test-I know 'cause I'm helping.

* Atari is Atari. Falcons are out in small quantities. The Jaguar is due out late '93 on the West/East coast, and early '94 elsewhere.

neil,

If the 1050 alignment is off, then chances are that it won't even boot a disk, or it will have a lot of trouble doing so. If the problem is that it sometimes won't read, or it doesn't like reading the inner tracks, then the problem will more likely be related to a read amp problem(the inner tracks are written at a lower strength than the outer tracks).

As for aligning-I have found that the 1050 aligns easiest with an alignment disk and a scope. I can align 810'S just by using a copy protected disk and twitching a screw until it loads right, which doesn't work as well with a 1050.

The M: handler is nice, I believe I have several games on a LACE disk (can't recall the number) that use the M: driver for either touch tablet, joystick, or STmouse. If you like Simon's M: handler, you should check out LACE disk #4 (found on the Puff BBS) for his E: handler. I'd replace the font with the font created by JRD for Kermit65 but that is the only thing I'd change. Really nice and acts very like the standard E: handler, only this one does 80 col. Only a few limits, does not support split screens, but what 80col device does...

>it 1987? :-)

The cassette interface requires (if I remember correctly) an FSK audio
wave, but it is straight ATASCII at something like 300 or 600 baud. I
had a little interface board that plugged into my 6800 sysdtem which
genenerated the correct audio frequencies from the RS-232 port of the
6800. I used the 6800 to download stuff from ACE in Oregon, then dump
it to an audio cassette recorder, and read it into the Atari with another
interface I built (I was too cheap to buy an Atari recorder). Anyways,
again from memory as all my Atari stuff is home, but the recorder also
demodulated the FSK on playback. So..... as an emulation, a straight
RS-232 to TTL conversion would work just fine, provided one allowed
the reasonable timing delays (start up, stop, etc). I am fairly
clear that the baud rate is 600 baud. The one interface problem would
be to pay attention to the _MOTOR_ signal on the SIO bus.

I've often wondered why some of the neat games on my old 2600 were
never ported to the Classic Atari line. One of the neatest was
Air/Sea battle. Another question that maybe some of you could answer-
why did the 2600 with only a 4K cartridge have so many game variations on
it and the XL/XE with 8 or 16K have so few? The 2600 Breakout game must
have at least 10 variations. These include a really neat twist called
breakthru. The XL/XE cartridge only has 4 variations.

: > the OmniMonXL ROM replacement. Gosh, I wish I could remember how to use
: > all this stuff!
:
: My god! :) You're going to try to remake a game JUST BY TRANSFERING
: FILES TO THE PC!? What will you do with it then? I mean, it's going to
: be TOUGH! When you write a game, you need to know a lot of stuff (unless
: you're improvising, like I used to do a LOT :))... You need the "rules"
: of the game. How the enemies and stuff react to different things, and
: when/where the come, etc.etc.etc.! If it's just going to be a Drol
: "look-alike", then if you know how to program, get at it. If you're
: planning on taking the actual game code and reproducing it exactly on the
: IBM, have fun!
:

No, no, no. I'm making a Drol look-alike, but I'm also trying to make it as close as possible to the original. One of my big problems is that I can't draw worth a d*mn, so I'm looking for a way to use my OmniMonXL to capture Drol screens and move the images over to the PC. Up to now, I've actually been pausing the game and "eyeing" the images into a PC paint program, but this is so tedious that I need a better way now.

I've got the basic framework of the game working -- what's left is mostly the details -- which is of course about 75% of the total effort :-)

BTW, I could use an experienced Drol player for a tester. Anyone here have a PC and might be interested?

:
: I mean.. every system has its own quirk/funny things to use... Like the
: Atari and the DLIs and VBIs and player missles and all sorts of other
: tricks!!! :)
:

I don't think Drol used any of those things. It seems to be a direct port from the Apple II version. As far as I can tell, it is straight Mode 8 with nothing but the aliasing effects for color. I still can't believe how well that game was made, and that they could do it at all on a 1MHz 6502. How they did the scrolling still boggles my mind (no, they're not using Antic's hardware scrolling). My PC version requires a 16MHz 386 at least, but it running at twice the frame frate (60 fps instead of 30), and on a deeper screen (8-bit instead of 1-bit)

Hello out there!

If anyone has an original copy of Drol by Broderbund Software, including
the documentation, I would like to buy it from you. I'm willing to pay
up to $50 or more for a copy in good shape. If you're interested in selling
your copy of Drol, please send e-mail or call (617) 229-9800 x216, or
(617) 894-1891 after 7PM EST.

3132. Re: 1050 Drive Repairs

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-26 16:10:51 UTC
From: popp@fledge.West.Sun.COM
Message-ID: <25inabINNbm2@west.West.Sun.COM>
Source record: 105392

The alignments of 1050's is performed by loosening the two screws
that hold the stepper motor in place, and then twisting the motor
to the right or left.

3133. Pin Specification: Old 8inch Drives

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-26 16:56:52 UTC
From: tramp@austin.ibm.com
Message-ID: <CCDLqs.362t@austin.ibm.com>
Source record: 105400

Would anyone out there have the pin information for 8 inch diskette drives.
I have an ATR8000 and an 8 inch drive but have no idea how to convert
the 50 pin connector to a 34 pin connector. I think the drive is made
by Control Data Corporation. Thanks.

Well, at least the Dutch "Mega-Magazine" includes some LZHd files accompanied
by Bob Puff's V0.1 unLZH program. I also remember another disk magazine
carrying this "unauthorized" version. So you see, you can't get this unLZH
out of the scene anymore. I've tried it too and haven't encountered any
errors so far.

> It starred Lee Mongomery.

PRIME RISK (Drama 1985 PG-13) After accidentally discovering a way
to break into automated banking machines, an engineer and a college
student stumble upon a plot to undermine the U.S. Federal Reserve.
Starred Toni Hudson and Lee Montgomery.

> I can't remember the name of the 'Reactor station with space
> mummy' movie either, but I think it starred Ben Murphy.

That's TIMEWALKER aka BEING FROM ANOTHER PLANET (this version
used on MST3K).

From: uj1g@rzstud1.rz.uni-karlsruhe.de
Message-ID: <25ivvv$bv9@nz12.rz.uni-karlsruhe.de>
Source record: 105395

Hi!

Have you ever tried to play those .MOD files on your Atari? No?
Try it! Just get the file

modpl122.dcm from the atari/8bit/Sound directory on atari.archive.umich.edu

This program can't play all MOD-Files, but quite a few. I enjoyed it very
much.

Also on new on a.a.u.e in the atari/8bit/Demos directory you'll find
the July issue of the German disk magazine "TOP-Magazin".

The files for that are:

top9307a.dcm
top9307b.dcm

Note: You'll need DISKCOMM for all this. You can find it on a.a.u.e. as well
(this is for all newcomers here on c.s.a.8.)

Have fun!

Laugh! Ghod I hate Qbasic when it does things like that. (I'm a Qbasic user too...) Since we've had some problems with 'padding' on Qbasic as well, I know where to ask for help!

3138. Wanted-Marble Madness

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-26 19:21:00 UTC
From: MIS0160@MVS.UDEL.EDU
Message-ID: <19930826142113MIS0160@MVS.UDEL.EDU>
Source record: 105394

In a post made a few weeks ago, I asked if Marble Madness had ever been released for the Atari 8bit. An old issue of Antic quoted a spokesman from Electronic Arts as promising it would be released. Two individuals responded to my post--one had seen a copy, the other had read a review of it. If anyone has a copy of Marble Madness for the Atari 8bit and would be willing to sell, I would like to buy.

>for a MIDI system... That's what I used for years.
>

It won't have a hard drive, though. That's one of the pre-requisites I
think for a killer system. :)

To be fair, I haven't seen many $600 PCs floating around that are "killers".
The system requirements for PCs are much more demanding for their software,
for whatever reasons we can all disagree on. :)

Plus, why should anyone buy a used ST? I mean, I don't think a $600 new
system should be like that.. long time ago, I remember new 1040STe machins
selling for $379. 4MB in SIMMS is $150. Use your $100 figure for a
monitor, and you're just barely over $600 with a new STe.

Also, an STe or TT is going to have features GEMulator doesn't emulate,
like stereo sound, MIDI, etc...

And in the case of the TT or Falcon, it doesn't emulate an '030, just an
'000 (what a moniker!) for compatibility's (and probably simplicity's :))
sake.

3140. Atari 8-Bit Stuff 4 Sale

Newsgroup: comp.sys.atari.8bit

Hardware
##

The Alien Group VoiceBox w/software $35.00
Atari 1050 w/US Doubler chips $60.00
Atari 1050 (stock) $30.00
Atari 850 interface $50.00
4 x Atari 800xl (stock) $40.00 ea.
Atari 800xl w/256k Newell & snitch switch $60.00
Atari XEP80 w/software & original packaging $50.00
Okimate 10 color thermal graphics printer w/2 carts & 2 rolls paper $50.00
Koala Pad w/software $25.00
410 data recorder $10.00
BEST TrakBall $15.00
XE Lightgun $15.00
4 x High Quality joysticks $6.00 ea.
2 x two player paddle controllers $5.00 ea.
2 x one player paddle controllers $5.00 ea.
1 x Axiom printer interface $15.00
1 x Eprom burner w/software & eprom $50.00
1 x SyQuest 5meg removable drive w/3 5meg carts $60.00
1 x 1020 printer/plotter w/3 rolls paper $20.00
1 x 2600 dust cover $5.00

Software
##
Atari Bookeeper w/CX85 number pad & original packaging $25.00
Facemaker $5.00
Disney's "Mickey and the Great Outdoors" $5.00
The Maxi Series CRIS (Cash Register Inventory System) package $30.00
Spy -vs- Spy $10.00
Seven Cities of Gold $5.00
Archon $10.00
Music Construction Set $10.00
3 x Fight Night $10.00 ea.
Prisoner 2 $5.00
Wayout $5.00
Clowns and Balloons $5.00
Homeword Word Processor $10.00
2 x Atari Writer $10.00 ea.
Atari Home File Manager $10.00
2 x SynTrend/SynGraph $15.00 ea.
SynFile+ $15.00

PeachTree Accounting, Accounts Payables $30.00
Zork I $10.00
Hitchhikers Guide to the Galaxy $10.00
Zargon III $15.00
Alternate Reality, the City $15.00

Note, all above titles are in their original packages/boxes w/docs!

Indus Systmes Master Diskette, Dos XL $10.00
Indus SYstems, GT Albert E. Spread Sheet $10.00
MagniPrint $15.00
Timewise $5.00
Atari 810/1050 Master Diskette II $10.00
Atari Dos 2.5 Master Diskette $5.00
4 x Atari Dos 3.0 Master Diskette $5.00 ea.
Smart 1030 $5.00
OmniWriter 80 for Omniview $15.00
The Pill Master Disk $15.00
Daisy Dot III (disk 1-2 registered version) $20.00
Action! Toolkit $15.00
Bank Street Writer $5.00
Microsoft Basic II $10.00
XE Term $5.00
The Atari LADS Assembler $15.00
Synapse Encounter $5.00
Genetic Drift $5.00
Alien Encounter & Face Flash $5.00
Creature Creator $10.00
Monster Smash $5.00
Shooting Arcade $5.00
Wallwar $10.00
Suspended $10.00
Realm of Impossibility $10.00
In Search of the Most Amazing Thing $10.00
F-15 Strike Eagle $10.00
Mad Spy -v- Spy $5.00
Forbidden Forest $5.00
Crypts of Plumbous $5.00
Wizard and the Princess $5.00
Dungeons of Despair (4 games in one) $5.00
Video Vegas $8.00
Karakteka $5.00
MULE $15.00
Wizards Crown (2 disk) $10.00
Ultima 4 (2 disk) $10.00
Kennedy Approach (docs, but no box) $10.00
Zork II (docs, but no box) $10.00
Touchdown Football $5.00
2 x 221b Baker ST (docs and accessories, but no box) $15.00 ea.
221b Baker ST, Library 2 disk $5.00
The Hulk $5.00

Gamma Software, Hockey $5.00
Fight Night $5.00
Bruce Lee $5.00
Ultima II (2 disk) $10.00
Run for the Money (4 games in one) $5.00
Super Huey (docs, but no box) $8.00
LeaderBoard $10.00
Solo Flight $10.00
2 x Summer Games $8.00
The Dallas Quest $5.00
Ninja $5.00
Phantasie (2 disk) $10.00

Firmware
##

Action! w/manual $40.00
Express! w/manual $40.00
AtariWriter w/manual $10.00
3 x Pole Position $5.00 ea.
Qix $5.00
Microsoft Basic II $10.00
MPP Smart Terminal $5.00
Pengo $10.00
Star Raiders $10.00
Eastern Front 1941 $5.00
Assembler Editor $15.00

Booka, Manuals, etc..
##

CompuServ Users Manual $15.00
1050 Owners Collection (Guide, Intro to OS, DOS OS, Field Service Guide) $35.00
TypeSetter $10.00
User's Guide to the 400-800-1200xl Computer, Software & Peripheral $5.00
Personal Computers & Games $5.00
Computer Playground (400, 800, 1200) $5.00
Inside Atari BASIC $10.00
101 Programming Suprises for the Atari $10.00
3 x SX212 Manual $5.00 ea.
Atari Games & Recreation $5.00
The Atari Assembler $15.00
Compute's 3rd Book of Atari $10.00
Mapping the Atari $10.00
Atari Player/Missile Graphics $8.00
Atari Roots (assembly language guide) $10.00
Games for the Atari $5.00
User's Handbook for the Atari $5.00
Indus Manuals (for virtually everything) $8.00 for the bundle

>
>Roger Tramp

From my most convenient source, not necessarily my most exhaustive:

Signal Five Inch Pin Eight Inch Pin

HIGH DENSITY 2 --
HEAD LOAD* 4 18
DRIVE SELECT3* 6 (--) 32
INDEX* 8 20
DRIVE SELECT0* 10 (14) 26
DRIVE SELECT1* 12 (12) 28
DRIVE SELECT2* 14 (--) 30
MOTOR ON* 16 (--) 16
MOTOR ON0* -- (10) 4
MOTOR ON1* -- (16) 6
MOTOR ON2* -- 8
MOTOR ON3* -- 24
DIRECTION* 18 34
STEP* 20 36
WRITE DATA* 22 38
WRITE ENABLE* 24 40
TRACK0* 26 42
WRITE PROTECT* 28 44
READ DATA 30 46
SIDE SELECT 32 14
GROUND 1-33 ODD 1-49 ODD

* indicates an active low (inverted) signal.

(xx) in the five inch indicates the IBM PC type twisted wired
pseudo-standard ... with each drive set for drive select
one (pin 12 to select drive, pin 16 for motor on). Twisted
cable swaps pins 12 and 14, and pins 10 and 16, as well as
the ground wires amongst those leads.

Are you sure your CDC drive is 50 pin? I have two odd-ball (relatively)
drives from some computer outfit (they are in cellar _someplace_) which

use 40 pin male/female pin type connectors, different pinout of course.
They were, I believe, used in loading the microcode for some DEC minis.
All standard 8 inch drives I have seen (not necessarily _all_ in the
real sense) use a 50 pin card edge connector. So count your pins.

Quality Software were the first to release Ali Baba and
Heracles (there were also Apple II versions). EA bought
the rights and re-released them together as Age of Adventure.

ACS was to be released for the Apple II, IBM PC and C64. It
didn't make much of an impression on me. (and I bought it at
a deep discount).

Adventure Creator was from Spinnaker (I think)... remember
Trains?

I have a couple of Atari power supplies. I'd like to know what systems they're made for (I believe 8-bit computer), since I'll be able to trade them if they are indeed for the 400 or 800...

Plug 1 - Has Atari logo on one side, other side has:
Model no. CA014748
120 VAC
60 Hz
20 W
Power Supply 41-79
9 VAC
15.3 VA

Plug 2 - Has Atari logo on one side, other side has:
Power Supply Part Number: C017945
Input
120V
60Hz
50W
Output
9V AC
31(?) VA

Anyway, I know they're not for any of the game systems, since they're AC instead of DC...

BTW, if anyone needs these, I'd be more than happy to trade (esp for a 7800 power supply if you have it)...

Thanks a lot!

Well, usually those 9V AC power supplies are used for Atari 8-bit disk drives
as well as for some (all?) Atari printers.

Hope this helps,

-Marek

I have the old Adventure Construction Set on IBM, but I believe it was released on all systemsa. BTW, that was Stuart Smith who wrote Ali Baba. Anybody know what he's doing now?

Anyhow, ACS wasn't turn-based, but timer based. In other words, move as far as you can before your timer runs out. And different characters had different timers. That turned me off right away. It was slooooooooow, too. I heard that on a C-64 is was REALLY snoresville. (Ha ha ha!)

The "old" C.S.S. Black Box?
"The company doesn't seem to exist anymore...." ?
I seem to remember some people saying that they were sending away for
C.S.S. Black Box floppy controller boards just last month! If C.S.S. went
under that would be "BIG NEWS" in the ATARI 6502 8-bit world. Upon what
evidence do you base such a conclusion? (Inquiring minds would like to
know!)

MF> What about the N.S.S. (??) speed enhancer for the old 800? Basically a

>Which end is that.

Kevin,

The small band at one end of the diode indentifies the adjacent wire as
the Kathode. The end on the other side is called Anode. Usually connecting
the Kathode to "minus" and the "Anode" to plus allows the current to flow.
Connecting it the other way round will prevent the current from flowing
through the diode.

I'm not very familiar to the SIO2PC kit, so I can't tell you the exact
purpose of the diode in your circuit. Maybe there's someone who can tell you
more.

I hope I could help you at least a little bit.

Just before Synapse's last breath, it was taken over by Broderbund.
I remember seeing SynFile, SynCalc, and SynTrend in a Broderbund
catalog. There were also a few Synapse/Broderbund collaborations,
released under the Broderbund name. Offhand, I can remember
two text adventures: Mindwheel and Breakers. Supposedly, these
were the best non-Infocom IF games released at the time.

Anyone remember the old Alternate Reality "series"???

The HUGE, multi-disk 3-d fast-scrolling, MULTI-DRIVE (option) adventure?

They were supposed to bring out 6 "installments" (I believe). The City
came first, then the Dungeon... Wilderness or the Palace was next, but the
company went bankrupt if I remember right. GREAT game! GREAT graphics!
(and... if you had the original 800 beast) -=> GREAT SOUND/MUSIC!
(Sure, the other's had ok sound, but you just HAD to have the 800, it really
was better... slower, but better)

As you went to the "border" of each section of the game, you could enter
the new "installment" (for lack of a better word at the moment). It turned
into a one way trip to the dungeon, but if you went from the dungeon to
the palace or the wilderness, you were supposed to be able to get back to
the city. Any one know if beta/alpha versions of the other scenarios made
it out?

Anyone map these bugger's out? Kind of huge... started but never finished.

AIM is still "around," but only for one more issue. Patricia Snyder-Rayl (of Unicorn Publications, publisher of AIM, and Pegasus Press, publisher of Connect) told me on Delphi that they plan to put out one more issue, and then any remaining subscribers (not including those who get AIM as part of club memberships) will be switched to Connect. After the sorry Mar/Apr issue that they came out with, I'm not as disappointed as I would be otherwise. (AIM wasn't much use as a combined user group newsletter anymore, anyway. BTW, the user groups paid for the AIM issues one at at time - at least ours did - that must be why our members won't be switched to Connect, not that I care!)

I have the AIM August '92 8-bit DOM. As far as I can tell from the magazine itself, that was the last 8-bit DOM issued (if not, I'd like to know!).

LU@KY !!!!!!

I've gotten Bob's unLZHer to view an LZH I got from a friend of some
WAVs, but when it tried to unLZH, it said something like

unknown @ompression: "-lh50"

When it views, it displays the first (only??) file as:

type: "-lh5-"

3176. ICD repair?

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-28 04:35:16 UTC
From: timuszyn@jupiter.cse.utoledo.edu
Message-ID: <1993Aug27.233517.5658@uoft02.utoledo.edu>
Source record: 105327

Anyone know of a place I can send an ICD interface to for repair? Is it cheaper to junk it? (It was about 4 years ago) They're rather weak, tend to fry REAL easily. The great ancient ones (old 6502's) and their minions (the add-on components) are impervious to meager lightning strikes, ICD parts tend to just die quietly and you find them toasted the next morning.

-Tim

PS: I've checked it out, the one main chip is toast, the minor components are fine (or so they seem / output).

PPS: Is the black box a better printer/modem interface? If I get enough encouraging replies, I may just switch over... like the idea of the hard drive option and floppy drive extension anyhow (could get to like the idea of reading and writing the 360k ibm format with the Atari!).

>only has time for about 20 instructions at most. And the
>GED.COM is only 3600 bytes. How can there be a 10k DLI?

Thank you for your comments.

As other people have pointed out, a more appropriate name for the kind of display loop in GED would have been 'kernal'. I did not know how many people were familiar with that term, and so I used 'continuous DLI' instead.

The 10K code is called as a DLI at the top of the screen. There aren't any restrictions as to how long a DLI can be -- it's just executing 6502 code like anything else. I stay in the DLI the entire screen. There are certain timing restrictions if you want to change something before the next scan line is displayed, but that's not the same thing. You can stay in a DLI as long as you want, and it can even be interrupted by other DLIs, if they're designed right.

The program creates the 10K loop, so it does not need to be part of the 3600 byte GED.COM file.

John Harris - jharris@cup.portal.com

>evidence do you base such a conclusion? (Inquiring minds would like to
>know!)

Okay, here is information reguarding C.S.S. It's alive and well, in fact
CSS has the inside cover ad in the current Atari Classics (which just
arived today). So, I called the CSS Bbs...Yeah, both lines are still there.

Here is the current information that I have.

C.S.S. BBS (Puff II)
Line #1 (716)-247-8355
Line #2 (716)-247-7157 (listed in the AC ad)
FAX: (716) 247-7158
Voice (716) 429-5639 (10am to 5pm EDT)

Address:
Computer Software Services, Inc.
PO Box 17660
Rochester, NY 14617

Likely what you had was the old information for CSS before Bob Puff acquird
it. I don't know... but I hope this helps.

Mike

Source record: 105340

J. Harris points out that GED enters DLI code at the top of the
screen and never exits the DLI code the whole screen.
I thought ANTIC would run concurrently with the CPU and the
DLI would interrupt CPU code execution, essentially stopping
the CPU, but ANTIC keeps running and when time comes will
fetch the next DL instruction and display the line. How does
(Forget the How does). Somehow, you are synchronizing your
code with ANTIC's timing? Well I liked the Martian.

Oh, I think Bob's unLZHer only handles the old LZH types of archives
probably -lh0- (if it exists anyway) or -lh1-

That's maybe the reason Bob doesn't want his 0.1 version to circulate.

I've got a program allowing to copy some multi stage load programs from
cassette to disk, as long as their subsequent loaders aren't encrypted.

I've successfully backed up the game "Last-V8" from tape to disk.
"Last-V8" is at least 3 stages.

This program for copying multi stage programs was printed in the ATARImagazin
(German). Maybe you can get a back copy from PPP or its foreign distributors.
The program is called either CASSIM or CASSIM2, I don't remember exactly.

I think in these gloomy days of Atari, 90% may be a bit low... ALL I'VE HEARD REFERENCE TO IN REGARDS TO ATARI NOW-A-DAYS HAS BEEN MIDI RELATED! Whenever I hear of someone doing some studio work, the Atari has been mentioned a majority of the time! They still plan on releasing some beefed up MIDI machine in the future or so I've read.

In regards to the sucks for anything else remark... wellll... other machines have finally surpassed it, took IBM/compat. software people YEARS to come up to the 1988/90 level of the ST. Look at the 3-d graphing programs it had when Harvard Graphics was stalling/screwing around! How about the CAD/3-d drawing capabilities Disney/MGM even used it for! Remember the red/blue "actual" 3-d software out? Needed to buy those silly goggles, but they had games, cad/drawing utilities, etc. for it! If the IBM software developers hadn't gotten off their asses and looked at the real world, that 'ole 68k might've still been big news!

Poor thing is outdated, but it's still big news in the recording industry!

: How is the 800 sound better than the XL's?

: Arent they just identi<al?

Whoa... all right! Another person that hasn't yet experienced the organ-
like rich sound of the old 400 and 800! It's just that: a bit fuller sound,
more of a rich organ echo from that beast. You REALLY have to hear it!
Atari enhanced the graphics clarity a bit on the XL series, but lost a bit in
the sound catagory... don't know what they did, but they screwed something up.

BTW: starting with the XL also, the actual speed of the unit increased.
Try compressing and decompressing some files on both!

Jeff_M_Lodoen@cup.portal.com

Here is what I found out:

Title: Zap: The Rise and Fall of Atari
Author: Scott Cohen
Publisher: McGraw-Hill
Date: 1984

Unfortunately, when I checked the local bookstores, I found that it has
been out of print for several years now, and is no longer available.
Sigh

Anyway, thanks to everyone for their help with this!

My original article:

I never understood the number of variations either. Also, how did people
convert 5200 games to the 8-bits? I have Cetnipede, Milipede, Space
Invaders, and a few others that are all 5200 games but run on my XL. Any
ideas? How different are the two systems?

My favorite game was the one wherein two player-controlled dogs chased around the playing field throwing bones at flashing firehydrants. A big chunky car would come out and clear the field at random intervals...

DOGDAZE was the name, I think.

Hours of mindless competition, until the joystick rash set in.

Although this is the sort of game that noone in their right mind would choose to play (or even KEEP) over a stack of Lucasfilm games or (wow) Drol, I would _really_ like to have a copy.

Please contact me if'n you have it or have seen it in the public domain.

wheeeeeeeeeerrrrronk!.........Meeeeeeeeeeeeeeeeeromp!

(Sounds o' Drol...)

Source record: 105259

Just on some off chance anyone from ICD (or someone who sold some of the ICD product line) is watching, DO YOU HAVE ANY SPARTADOS X CARTRIDGES LEFT?

I bought one of the first releases years before, but it was buggy, tended to ignore my main drive (ASTRA The One). I NEEDED TO USE THAT DRIVE! ds/dd, printer port, basically a multi-floppy controller built in... had to return the darn thing since I really had no use for it then. Too bad, darn thing had potential... but even the earlier versions of SpartaDos from disk worked fine with my drive... what they screwed up on for X I guess I'll never know... something about not being able to access the whole disk... kept giving me drive errors right and left. When I used Sparta 2.3, it worked fine (yes, same disks!).

X watching,
Tim.

> I lost my SX212 book somewhere and I was wondering if anoyne had a handy
> list of Hayes commands, to control things like dialing speed, speaker
> volume, and the like...

I had one of those modems a few years ago. The dialing speed is
controlled by the S11 register (ATS11=40 should work). As for speaker
volume, there's a hole in the bottom of the modem that you can use a
VERY small screw driver to adjust the volume. Or, you can set the M
register to 0 to turn it off altogether (ATM0)

3200. Indus GT disk drive and other stuff...

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-29 04:39:26 UTC
From: winters@access.digex.net
Message-ID: <25pbtu$i01@access.digex.net>
Source record: 105261

I just got an Indus GT disk drive and an 800XL machine at my
Laurel Thrift Shop neighborhood Atari 8-bit "dealer" for $30 and
really love the Indus. I will have to do some benchmarks on this
drive compared to my old 850, but it sure is a hell of a lot quieter!!
Does anyone know the access time compared to an 850? I saw somewhere
that the 1050 is close to being as fast as the Indus. Would anyone want
to purchase the 800XL machine or possibly trade me some software for
it? I have BASIC XL and regular BASIC cartridge (CXL4002), but not
hardly anything else. By the way, when I first purchased the drive and
800XL today, I originally saw a 130XE in a box all wrapped and sealed
up. When I was a few miles away, I cut the box open and noticed that
there was a 600XL inside!! After spending 30 whole bucks, I was furious
that someone would have donated a "bogus" 130XE to this junk store
for me to think I was getting the 8-bit deal of the century!!
I went back and when informed that "no refunds under any
conditions" is the thrift shop's policy, I noticed the Indus and 800XL
sitting in a pile of junk on the floor, in a Atari "The Programmer" box.
(Brings back memories of 1980!! :--)). So I exchanged the 600XL for
the INDUS and 800XL - one final question that has been bugging me -
I see lots of Apple II vintage computer systems being sold for
astronomical prices, compared to Atari 8-bit stuff. Is there something
that fantastic about Apples that warrant $400 -$700 for an 8-bit
computer system?

>the CPU, but ANTIC keeps running and when time comes will
>fetch the next DL instruction and display the line. How does
>(Forget the How does). Somehow, you are synchronizing your
>code with ANTIC's timing? Well I liked the Martian.

Realize that a DLI doesn't stop the CPU. It just causes the CPU to jump to a new section of code. Once the DLI has occured, executing the code in the DLI routine is just like executing any other code. ANTIC still runs concurrently.

The DLI at the top starts everything in sync. From that point, there are 59 machine cycles per scan line, so the 10K kernal in GED duplicates a 59 cycle color stuffing segment 200 times -- one for each line. That's what keeps everything in sync.

John Harris - jharris@cup.portal.com

3203. ModPl122

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-29 08:48:41 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <uZc29B2w165w@cyberden.sf.ca.us>
Source record: 105269

Well.. I got the MOD player for the 8bits... and, well, I @an already
bit<h about it! :)

It seems to BOOT during play if I hit the [shift] key
(TWI@E it hasnt..!?)

It only does D1: and D2:, but ONLY PHYSI@AL DRIVES, too, whi<h
sux for us RAMdisk lovers... is there a tekky reason for this?

It boots when you exit, rather than jumps to DOS
(huhuh.. if I wanted to boot, I'd use my @old start..huhuh..
hmm..heheh..hemm.. yeah... hehe)

It has only played two MODs out of the four I now have:

Ba<ardi - it @ame with it. Ni<e.. starts playing
garbled noise after playing the song on<e

Bladerun - although the MOD seems to have too low of
bass for the player to handle

THe other two are:

Little - it says "NOT A MOD FILE!"

Mod - it says "NOT A MOD FILE!"

ANd one more I made, whi<h is a haked version of Little:

Little2 - guess what it says?

The diff. between little and little2 is this... well, I'll explain what I
saw then what I did..

I read the first bun<h of bytes from BA@ARDI.MOD.. It goes
something like this:

20 bytes of "name" - like "Ba<ardi" and a bun<h of [^,]s (0s)

30 bytes of "name" and other stuff for ea<h instrument.

Ba<ardi has 31 instruments.. ea<h 30th byte for the inst. is a [^A]

Little and Mod have 15 instruments, most ending with [^A].. So... I have
now no idea what else to fix in the file to make it work.

I forget what type of MODs this player is supposed to handle, but, at 70k
or so per file at 1200bps, I think I'm going to hold out on DLing any
more MODs until I get a way of being sure ALL, or at least most (not half
or less!) MODs I get play.

I know.. even GIFs have tweaks.. GIF87a's vs. GIF89a's, but there are very few 89's that I've @ome a<ross, and I've gotten them to work by messing with the header bytes. As for MODs, I dont have DOX to them! I only have a lame @-sour<e with little/no @omment as to what the HELL its doing and looking for, and sin<e I dont KNOW @, it doesnt hel
help ME at all! >:^(

SO!? Anyone wanna tell me what to do? Anyone else have lots of trouble with Modpl?

When was it released? It's (pd) 1992-1993 (O<tober thru April)!!

What newer versions are out? Any better interfa<ing ones? (ie, something that jumps ba<k to DOS, something that uses 128/256/et< K ram instead of only the base 48/64..?!, something that handles a wider variety?)

I know... I know... it just @ame out.
I know it's impressive
I know it's a breakthru
I know it's only version 1.22

But I'm NEVER satisfied!? You all know THAT! :)

BTW- where @an I get a @opy of return of the jedi: deathstar battle for either the 2600 or the XL/XE!?!?!? :)

l8r!

Many people have sent me questions regarding available mirrors and
frequency of updates. Well, here's the scoop, to the best of my knowledge.

Mirrors and frequency of updates:

wuarchive.wustl.edu:/mirrors/archive.umich.edu
-Updated nightly.

info2.rus.uni-stuttgart.de:/afs/umich.edu/group/itd/archive
-Direct afs link, updated instantaneously.

archive.orst.edu:/pub/mirrors/archive.umich.edu
-Updated nightly.

src.doc.ic.ac.uk:/packages/atari/umich
-Updated nightly.

Please note that uploading is not permitted on any of these mirrors.
Uploads must go directly to atari.archive.umich.edu.

If you know of any other site mirroring a.a.u.e, please contact
me to let me know.

If you have an afs site willing to accept ftp to archive.umich.edu,
please contact either myself, or myke@archive.umich.edu.

>Try compressing and decompressing some files on both!

I think it's just the OS that's faster on the XL. To name one difference,
only two joysticks and four paddles are supported, so fewer shadow register
updates need to be made during the VBI.

The controllers are handled differently. Hardware registers are in
a different page. The boot procedure is a bit different. A game with
both XL and 5200 versions can share 98% of the same code; there aren't
any fundamental differences between the two machines (same graphics,
same sound, same CPU).

See an old issue of ANALOG (around issue 15 or so) for a detailed
article on porting Atari computer games to the 5200.

3208. Atari 7800 (+2600) items for sale

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-29 19:30:08 UTC
From: cohen@GOMEZ.phys.virginia.edu
Message-ID: <00971C09.D7EE2160@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 105268

Hello,

I am selling Atari 7800 and 2600 items. If you find something you like,
please make offer via E-mail to address COHEN@GOMEZ.PHYS.VIRGINIA.EDU
(or call (804) 293-8973 in case you have no e-mail account).
I will sell to best reasonable offer; or, if I get a good offer in the
meantime, I will accept it immediately without further delays.

Thanks!

Atari 7800 ProSystem and items for sale-

Atari 7800 ProSystem main unit, TV video cable, power supply, and the
2 original joysticks.

I also have Another Atari 7800 main unit with one original Atari 7800 joystick,
but I do not have the power supply for this unit (takes 9V DC @ 1 Amp.). It
works well. (This might be useful for somebody who wants to replace a broken
unit, or owners of 7800 systems who want a backup main unit/joystick, or for
somebody who will -- hopefully -- buy the complete Atari 7800 ProSystem above
and wants a backup hardware set, or for those who are willing to get the power
supply cable on their own.

Atari 7800 cartridges-
Pole Position II
Super Huey
Xevious
Touchdown Football.
(I think there are a few more cartridges, I'll have to do a better search.)

Also have the Atari 7800 color poster.

I also have a large number of Atari 2600 items (joysticks, many cartridges)
that are fully compatible with the Atari 7800 ProSystem and run perfectly
on it:

Atari joysticks

Higher quality game joysticks (various types).

Atari paddles

Official Atari Log Book (like new)

A series of Atari catalogs from different dates.

A storage box for 24 cartridges (Atari 2600/5200/7800) or cassettes or even
8-track casettes if the need arises. Wooden base, smoked clear hard-plastic

top, blue velvet-like inside.

2600 CARTRIDGES- also run perfectly on the 7800 machine-
Home Run
Video Pinball
Astroblast
Outlaw
Super Challenge Baseball
Grand Prix
Donkey Kong
River Raid
Fishing derby
Breakout
Indy 500
Astroids
Activision Freeway
Skiing
Target Fun 27 TeleGames
Activision Commando
Activision Kaboom!
Activision Kung-Fu Master
20th Century Fox Revenge of the Beefsteak Tomatoes
Apollo Final Approach
Parker Brothers/Sega Frogger
Football
Night Driver
Championship Soccer
Basketball
Video Olympics
Space Invaders
Circus Atari
Air-Sea Battle
Defender
Combat

If you find something you like,
please make offer via E-mail to address COHEN@GOMEZ.PHYS.VIRGINIA.EDU
(or call (804) 293-8973 in case you have no e-mail account).

Thanks!

3209. Re: GED and J. Harris

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-30 00:49:24 UTC
From: cb541@cleveland.Freenet.Edu
Message-ID: <25riqk$cfj@usenet.INS.CWRU.Edu>
Source record: 105271

(Mr. Harris pointed out that the precise timing of GED
allows it to enter a DLI and stay there.)
I guess GED also increments the clock, because the attract
mode begins after 10 min. Since GED is in a DLI all the
time, the OS VBI routine must be disabled.
I have some Steve Dong .obj files (Roxanne, Challenger,
Desire, CityDemo) that must use DLIs to get all the color
Mr. Dong got in those pictures.
I did load some 7680 byte pic files I had into GED. That
was done by saving a blank GED screen, then putting the
first 3302 bytes of that saved file in front of my pic
file and adding 320 0's on the end of the file.

>
> Also, an STe or TT is going to have features GEMulator doesn't emulate,
> like stereo sound, MIDI, etc...

Well, for one reason, not everyone has the room for one more computer
system on their desk. I have never owned an ST of any ilk, only Atari
8bits and now a 486DX e/w 8Meg and a hard drive. I would buy the Gemulator
just to run some of the 8bit software I would like to continue to use and
some of the ST software that I would be interested in owning that is either
more expensive or not available for the MS-DOS machines. Sure it may not
have full compatability nor be able to run all the things a real ST or
Atari 8bit could run, but it sounds good enough for me.

3211. ATR8000 Hard Drive help

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-30 14:22:29 UTC
From: barrett@clpd.Kodak.Com
Message-ID: <1993Aug30.142229.1660@clpd.kodak.com>
Source record: 105275

I have an ATR8000 with a hard drive interface in it. It looks like it's
SCSI, a 50 pin ribbon connector coming out the back. Anybody know about
how to use it? What drive address is it looking for? Any help would
be appreciated.

Chris

From my understand of AFS, you should be able to upload stuff through
the uni-stuttgart FTP server. Unless their server doesn't allow it.

Try using it with MyDOS. There it won't BOOT after hitting the SHIFT key.
BUT, with MyDOS you'll have another problems, because Modplay expects the
DOS 2.0, 2.5 sector link format. You can use it though with MYDOS disks
formatted in SD.

Looks like the answer is "no", there is no uploading to the uni-stuttgart
site - uploads must go directly to atari.archive.umich.edu.

I usually just make a procedure that contains a ML code block. You could
code a VBI in ACTION!, but I imagine that you would want it to run as
quickly as possible.

PROC VBI_routine()
[ $XX $XX $XX $XX $XXXX ...
{insert your ML VBI here}
]

then, just set the VBI vector to point to your VBI routine and set up the
DL to use it.

CARD VBI_vec=$xxxx ; Sorry, I forget the address (that's what Mapping the
; Atari is for anyway!)
VBI_vec = VBI_routine

I think the above assignment is legal (haven't coded this in a while). If not,
I know you can just PokeC the address of the routine into the vector. This
is pretty sketchy, but I don't write this stuff often enough to commit it to
memory. Hope it helps anyway.

Opps!!! Looks like I didn't think about what I just read (and the response that I wrote as well!!!) Mr. Kendrick was asking about a VBI in ACTION!, not a DLI, which is basically what I had explained (although I typed VBI about 7 times, my mistake didn't dawn on me until I posted the messgage!).

For VBI's in ACTION!, I usually have 3 procs.
Install_VBI()
Kill_VBI()
VBI()

The Install_VBI and Kill_VBI are just two simple code blocks. Install_VBI loads the high and low bytes of the address of the VBI proc into the x and y registers (never can remember which goes where), and the interrup type into the Accumulator. It then jumps to the VBI install routine (Sorry, but I don't have any doc's at work). The VBI routine is also just a ML code block (I have never tried to actually let ACTION! compile code for use in an interrupt. Has anyone tried this???)

The Kill_VBI just set the Vertical Blank handler back to it's default setting.

I just call Install_VBI() in my init proc, and then call Kill_VBI before anywhere that I exit back to DOS.

Sorry about the mis-information in my previous post.

: features would this second version of Pilot of added? Maybe, I'm being
: cynical, but there seems a limit as to how far this language could have been
: taken to...
Well, I know that they WERE writing an extended Pilot, but that was about
the time that Atari started getting into financial trouble, and they
gutted their R/D department. Pilot flew out the window :-O

I remember calling Atari support, and bugging them about the language. They
finally sent me some of their developer's information. It was some of
the "undocumented" features. I don't recall what that was, but I think
I still have the documentation and the ROM cart around somewhere.

I always liked PILOT; I even wrote a PILOT interpreter on a mainframe,
in COBOL!!!!! (Only language available to me at the time). I used it
to write simple scripts for training console operators.

3218. figured out something in MODPlay

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-30 23:25:59 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <10B59B4w165w@cyberden.sf.ca.us>
Source record: 105280

If you've got the file CHINIT.COM (Chaos Loader initializer), then run it on a freshly formatted (Atari DOS, MyDOS, etc.) disk.

Then copy AUTORUN.SYS from the MODPLY122.DCM (Mod Player 1.22) disk onto the disk as MODPLAY.EXE or whatever.

Then reboot the computer and type [A] to load the MODPLAY.EXE file.

What the hell does this do?

Well, when I used MODPLAY with Atari DOS 2.5 (boot the .DCM disk) or with MyDOS 4.53/4 ([L]oad AUTORUN.SYS from the .DCM disk), whenever I'd press [SHIFT] to exit the ACTUAL playing of a song, I'd (USUALLY!?) reboot!

I decided to try using MODplay without any DOS (using the Chaos Loader.. I'm sure most other loaders will do. Note: Most of these loaders don't work with a stock 1200xl, but then again, neither does MODplayer!).

Since it only physically accesses disks (it ignores things like MyDOS's RAMdisk = drive 2!), and only accesses D1: and D2: PHYSICALLY (NOT thru DOS!), it still knows how to load.

I think some of this has to do with the fact that Gatekeeper made some funky loader that processes the bits of the sound data AS it loads. Very nifty. Also a pain at times! :)

Note another thing: Pressing [ESC] from the "Insert disk, <etc>" prompt will STILL reboot. (Where will it go? DOS! Not when you ChaosLoaded it! Haha!)

Anyways... Gatekeeper, if you're there! Here's what I'd LOVE to see!:

MODXVERT.COM - convert MODs to some Atari (4bit) format
MODPLAY.COM - possibly even a SpartaDOS external (for you SDOS fans) - load the Atari (4bit) MOD and play it.
and any other MOD playing routines for, say, Action!, C, BASIC, etc..

It'd all be really cool! :) :) :)

(I mean, I HATE waiting to load/processes from a stock 1050! ARGH!)

Also, I'd kill to see all of it work on any DOS (MyDOS, etc.. 'course, not working with Sparta is just FINE with me! <:^P haha!).

So.. that's what >I< have to say about all this!

MODPLAYER is cool.

Also, Friday (see Halle93 demo!) has made (damn forgot the name) a .MD8 player (plays that type of MOD) and will personally convert MODs to .MD8's for you.. (WHat does he use? If it's on the Atari, just release it!)

He wants 10DM for it, but it's not (c)'d (it's shareware).

Rick Detlefsen stated that if a 1050 has alignment problems, then it
probably wont even boot, etc..

Not necessarily true. I've noticed that if a disk is formatted with an
off-aligned 1050, then that disk will continue to function normally.
Just disks that have been created with another drive will
malfunction.

In article <25j4of$foh@cville-srv.wam.umd.edu> cmedley@wam.umd.edu (I own Bear) writes:
>And in the case of the TT or Falcon, it doesn't emulate an '030, just an
>'000 (what a moniker!) for compatibility's (and probably simplicity's :))
>sake.

Once again we have some naive idiot running around pretending to know
something. Yes, he knows that a 68030 is better than a 68000. Everyone
keeps telling him that. But he doesn't say why it's better because he
doesn't really know. True that in the rights hands, like Apple or Amiga,
the 68030 can do some amazing things compared to the 68000. In the hands
of Atari, the 68030 is just used as a fast 68000. So whether you have a
16 Mhz 68000 or a 16 Mhz 68030, it doesn't really make that much difference.

Explain to me why emulating a 68030 would improve things? As was already
explained to your buddy Warwick a few days ago, there is a lot of Atari ST
software out there that flat out does not run on a 68020 or 68030 without
having to be patched or re-written. Programs like Tempus, Magic Sac,
ST Xformer, most AUTO folder programs, a lot of older programs such as
those written with GFA Basic, etc. So when you buy a TT or Falcon you
can kiss a good chunk of the Atari ST software base goodbye.

So what do you want? A 68030 emulator for the sake of emulating a 68030,
or something that's compatible with Atari ST software? In your naive world
all you know is "68030 good, 68000 bad" and I think you need to stop and
rethink that.

It's bad enough that for years Atari gave minimal support to developers
regarding anything about the ST, leaving it up to them to reverse engineer
things and write hardware or 68000 dependent code, but then they come out
with 68030 based machines and surprise, surprise, half the stuff doesn't run!
The 24BIT.PRG utility helps matters in a few cases but not all. For example,
it allows Tempus to go from crashing at load time to crashing at exit time.

The bottom line: you're better off with a fast 68000 than a 68030 chip as
far as running Atari software goes.

Also, you would seem to imply that there is something you'd be able to do
with a 68030 that you can't on a 68000? Like, is there some special version
of Calamus that only runs on the 68030? A special version of Word Writer?
Of anything? Hardly.

You're confusing the issue of speed with the issue of processor. Yes, a
16 Mhz 68030 is faster than an 8 Mhz 68000. Duh! Not much faster than a
16 Mhz 68000 though. Certainly a lot less compatible as far as Atari ST
software goes. On a fast PC Gemulator gives you 68000 emulation at the

speed of a 68030. Speed AND compatibility. Oooh, what a concept. Pinch me
I must be dreaming.

Well, from the manual they offered extra information on request for using input from the joystick port, [e.g. joystick, light pen, etc]; and a command which allowed PEEK/POKE equivalent statements. I've gotten to know the old manual, as I *rediscover* the language lately... I even joked to a friend about calling the number listed on those "undocumented" features.

>in COBOL!!!!! (Only language available to me at the time). I used it

I guess, from reading up on the language, it was originally developed in the 60's for this purpose, Computer Aided Instruction (CAI). I hadn't realized that before. I thought [from the Atari version] it was a poor man's logo.:)

Message-ID: <9308310202.AA16612@smithkline.com>
Source record: 105281

[Bob, I'm sending this for Jeff McW.]

This is for "Mr. Fixit":

Computer Software Services is VERY much still in business! And yes, they still sell the Black Box, & the Floppy Board, & a whole bunch of other goodies as well!

Contact CSS at: P.O. Box 17660
Rochester, NY 14617
voice: 716-429-5639
BBS : 716-247-7157

Bob Puff runs the show up there these days, he's the most active hardware developer we have! (He's also a sysop in the 8-bit area on CompuServe.)

CSS is a regular advertiser in ATARI CLASSICS Magazine (oh gosh, next thing you'll be saying you didn't know the 8-bitters had a magazine). AC has featured several articles on CSS products such as the US+ & the BB/FB. I myself am using many of CSS's fancy gadgets to run AC-- in the August issue I have an article describing how I use SyQuest removable media drives with my 800XL/BB/FB.

Happy Computers no longer services the 8-bit community. Recent info from AC's Advertising Editor (who keeps tabs on these things) is that the Happy guy is still around, may even have a handfull of 1050 upgrades lying around somewhere, but gave up our market a couple years ago. No big loss, the Archiver from CSS does pretty much the same thing as the Happy did, maybe better.

As for AC, send your POSTAL mailing address to me at:

poehland@smithkline.com or
poehland%phvax.dnet@smithkline.com

& I'll see to it you receive a free info-pak describing AC including our handy-dandy subscription form.

Hope this helps!

Dartmouth has the book. You can get the card catalog info (including
ISBN) by telneting to lib.dartmouth.edu and entering the command "find
title atari" followed by "display long." (Since I have it on screen
right now, it's published by McGraw-Hill (1984) ISBN 0070115435.)

I assume any library could get it from Dartmouth or a closer library
through inter-library loan.

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Darek, you sure know how to make a sale.

I give you a coherent set of arguments, rationally, for why your product
is maybe not quite as peachy keen as you make it out to be, and blam! I'm
an idiot.

(maybe it is just me, but why should anyone buy a product from someone
who stoops to personal attacks the moment their product is criticized?)

>something. Yes, he knows that a 68030 is better than a 68000. Everyone
>keeps telling him that. But he doesn't say why it's better because he
>doesn't really know. True that in the rights hands, like Apple or Amiga,
>the 68030 can do some amazing things compared to the 68000. In the hands
>of Atari, the 68030 is just used as a fast 68000. So whether you have a

Well is it? We all know the Falcon has a '030 attached via a 16-bit bus
to the memory. Unless we use a 3rd party board, we can't use FastRAM to
get 32-bit access via the CPU.

But in no way have I seen any benchmarks that show a Falcon running in
ST graphics modes to run the same speed as a comparable 68000.

>16 Mhz 68000 or a 16 Mhz 68030, it doesn't really make that much difference.
>
>Explain to me why emulating a 68030 would improve things? As was already
^^

Well, Darek, since YOU are such an idiot, let me lay it out for you in simple
terms.

For one thing, you are the one claiming you are offering a machine as fast
as a Falcon.

According to your own mailing, it's not.

Your GEMulator runs as fast as a 16mhz 68000 on a 50mhz 486 machine.

You're full of it if you think that we're all supposed to believe it is going to perform as well as a Falcon.

The only time it should come even close to Falcon performance when number crunching should be when the graphics chip is stealing tons of time from the CPU.

My point, Darek, if you would pay attention, which apparently is not your strong suit as you think you know it all... is that the Falcon should be able to consistently outperform what YOU claim your emulator runs like: a 16mhz 68000.

I am not suggesting in any way, shape, or form that you need to make a 68030 emulator. What I am saying is that if a user wants raw speed, they would need a high-end PC (486/50 or better) to equal a lowly Mega STe or slightly better.

My point is that if a user wants a fast Atari system, they would do better to get a TT or Falcon because GEMulator wouldn't offer the same speed increase on their current ST software as those machines would unless you ran it on a Pentium.

Have you priced Pentiums lately, Darek?

Also, if you weren't too busy turning into a major asshole, you would have noticed I advocated your GEMulator as being more flexible, and I *thought* I had offered only constructive criticism.

If you can't handle it, then that's your problem.

>explained to your buddy Warwick a few days ago, there is a lot of Atari ST
>software out there that flat out does not run on a 68020 or 68030 without
>having to be patched or re-written. Programs like Tempus, Magic Sac,
>ST Xformer, most AUTO folder programs, a lot of older programs such as
>those written with GFA Basic, etc. So when you buy a TT or Falcon you
>can kiss a good chunk of the Atari ST software base goodbye.

And when we buy a GEMulator we're giving up our money to a no-name 3rd party company that may or may not be committed to the "idiots" who buy their product, right?

>
>So what do you want? A 68030 emulator for the sake of emulating a 68030,
>or something that's compatible with Atari ST software? In your naive world
>all you know is "68030 good, 68000 bad" and I think you need to stop and
>rethink that.
>

Darek, if you even read this post this far, I hope you realize that I've been running on a 16mhz 68000 since late 1990. I've got a close friend whose system is based on the Fast Tech 25mhz 68000 system. We've both seen Falcons and TTs and our systems aren't even close in performance.

If your GEMulator, at best, does the same performance as his 25mhz 68000, and we see for a fact that a 25mhz 68000 can't match up to those machines,

how can you claim GEMulator is anything more than a painfully slow emulator
which needs an incredibly fast CPU to make it even tolerable to use?

>It's bad enough that for years Atari gave minimal support to developers
>regarding anything about the ST, leaving it up to them to reverse engineer
>things and write hardware or 68000 dependent code, but then they come out
>with 68030 based machines and surprise, surprise, half the stuff doesn't run!
>The 24BIT.PRG utility helps matters in a few cases but not all. For example,
>it allows Tempus to go from crashing at load time to crashing at exit time.
>
>The bottom line: you're better off with a fast 68000 than a 68030 chip as

^^
>speed of a 68030. Speed AND compatibility. Oooh, what a concept. Pinch me
^^^^^^^^^^^^^^^^^^

If a 486/50 runs GEMulator at 16mhz 68000 speeds, I'd love to see this. :)

>I must be dreaming.

You are. :)

3229. VBI in Action!

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-31 07:37:02 UTC
From: snyder10@convex1.tcs.tulane.edu
Message-ID: <25uv2u$cd6@news.cs.tulane.edu>
Source record: 105288

I believe Bill posted, not that long ago, looking for an example of how to call a VBI in Action!. Well, here goes.

If you recall, to setup a VBI you have to load the X register with the MSB and the Y register with the LSB of the location of your Vblank routine. The A register holds the VBCMD, 6 for immediate mode (VBI's less than 3,000 cycles) or 7 for deferred mode (VBI's up to 20,000 cycles). Immediate mode routines are executed every VBI. Deferred mode VBI routines can be skipped when the interrupt's time critical flag has been set. Once the registers are loaded with the proper values, you do a JSR through SETVBV. Your VBI routine should end with a JMP through XITVBL.

You'll recall also that Action! loads the registers in the following order, A, X, and Y. So, to do the above in Action! you'd setup a procedure something like this.

```
MODULE

DEFINE JMP="$4C"
CARD XITVBL=$E462

PROC SETVBV=$E45C(BYTE VBCMD,VBMSB,VBLSB)
RETURN ;not required

PROC VBI()

[YOUR VBI ROUTINE HERE
JMP XITVBL]
RETURN

PROC MAIN()

SETVBV(6,VBI/256,VBI&255)
RETURN
```

Also take a look at a look at Analog issue 51-3 (if you can find 'em) for a look at VBI's and DLI's. There's also "The Atari Assembly language Programers Guide" available from ATV, written by the two fellows who wrote the Analog articles.

Hope it helps

I don't know! Most ST hard drives come with ICD boards but I never got a manual so I can't check. Some FTP sites have the latest ICD utilities files which would have the address. There is a US and a German office I believe. ICD stuff is very common though so someone else here must know.

ISTR - I seem to remember.

The other day I came across a 400 and 800 Atari motherboards along with the respective power supplies. These appear to be new and are sealed in plastic with the Atari label on it. Also, I have two other boards that seem to plug into these. One plugs into the larger slot and one into the smaller one. Any guesses?

These are really no use to me, so I am putting them up for sale at best offer.

Email your bid to:

3235. How to use 130XE RAM Disk

Newsgroup: comp.sys.atari.8bit
Date: 1993-08-31 12:11:06 UTC
From: winters@access.digex.net
Message-ID: <25vf4q$1j7@access.digex.net>
Source record: 105295

I am about to acquire a 130XE, since I vaguely remember a store in the mid 80s telling me that you can use RAM Disks on this machine. Could someone please give me an example in BASIC how you would open & save your program you are working in, on the RAM disk? For example, you first load a program called "D:COBOL.BAS" from your 1050 drive and add a few lines of BASIC. Then, you want to run the sucker to see how the program is working. But, first you want to save it to your RAM disk, so you don't have to save it to your floppy drive.... How would one save & load back in a program on your RAM disk? Thanks a lot for any information on this question....

Well, I have to score one for Atari here... never had anyone there call me
an idiot publicly if I criticized one of their products.

Actually, Darek never addressed some of my other potential criticisms to
GEMulator, namely:

- lack of MIDI support
(i think i've made a case that MIDI users spend as much $$$ on their
software as the DTP users he aimed for with GEMulator)

- no guarantee that the product will be upgraded
(this WAS a trivial concern initially, but now... if he is so fickle, how
can anyone be sure he won't just have PMS and drop the product next
week because he feels irritated?)

- the fact that GEMulator requires a 50mhz 486 to run 2X the speed of a
stock ST makes it obvious (to me, at least) that a power-user who wants
a "faster ST" for things like, say, the GNU compilers or anything of that
ilk, might be better off with a TT (which can run 3-6 times faster than
an ST) or even a Falcon. And either way, they also get "bonus" hardware
(like stereo sound, localtalk ports, > 8MB limit, newer TOS version(s),
the 56001 DSP (Falcon), et. al.) which GEMulator doesn't emulate.

However, even if Darek has been a bit of a net-jerk, I have to say I think
GEMulator is a nice job of programming (sounds like it must have been hell

to do), but I just think both the product (and perhaps its author? :)) need to mature a bit in order to appeal to a wider base of users.

Message-ID: <9308312114.AA07823@koedgw01.delcoelect.com>
Source record: 105302

In recent discussions with a collegue, he had come across a console that interfaced an ATARI 800 with a 12 inch LASER disk, stereo sound system, color monitor, and a floppy drive. The entire system was contained in a rack mount cabinet and looked like it was used for a store demonstration of the ATARI 800. The interface between the laser disk and the 800 was a box with a silk screen label "ATARI LASER INTERFACE BOX" on the cover that plugged into the 800 SIO port. The box is about 8-1/2" x 12" and comes with a floppy disk to boot the system labeled "ERIC BOOT DISK". After the system was booted from the floppy, you could call up games, music, and demo's from the laser disk. It also had the capability to overlay the ATARI graphics over the laser disk picture. My question is does anybody know anything about this system - especially documentation, schematics, ect. I assume this was put together around 1985.

Message-ID: <9308312340.AA27248@smithkline.com>
Source record: 105303

Once again, this for "Mr. Fixit", whoever you are.

Yes, the PSI RAMdisk utility is good for most 6502's (not sure about 400/800, DEFINITELY for XL/XE).

The prgram was distributed as Shareware on AC's June Software Disk.
Sheesh, after admonishing our readers to pay their shareware fees like good little boys & girls, now here Nate goes & turns the thing into the Public Domain. Not that I'm complaining, I just think his timing sucks.

PSI stands for... ummm... damn I forget... <something> <something> Innovations, somebody I'm sure will fill in here.

The PSI RAMdisk utility is absolutely the best I've seen for Sparta users, it supposedly will format up to a 2-meg RAMdisk. It identifies how much RAM you got in your machine & will format it for you in any way you want, it's very flexible & powerful.

I finally fixed my flaky 1-meg Newell upgrade & it works fine with the PSI utility. I set aside the lower 128K for XE memory, PSI with Newell still gives me a 960K RAMdisk. Now I can ARC an entire issue of text for AC in one pass! Hot diggety! No more s-l-o-w floppy drive! Neat-o!

AC's Moonlight Workshop columnist has promised to cover software-based RAMdisk utilities in his next installment of "The AC Guide To Expanded RAM" which will be in December. He discussed ROM-based utilities in the August issue.

If you aren't reading AC you're missing the boat.

BTW I'm given to understand the MAC/65 portion of Hartwell's upload is corrupted & won't UUdecode. Anyone out there confirm that? I'd to see the PSI utility put up on CIS, GEnie & Delphi if someone out there will do the honors.

From: poehland%phvax.dnet@smithkline.com
Message-ID: <9309010003.AA27358@smithkline.com>
Source record: 105304

Latest info I have on AIM (from Pattie Rayl a week ago) is that AIM is now dead. Pegasus (Unicorn) will be rolling old AIM people over into their new Connect magazine.

Back in May she told me they had a June issue of AIM "in production". When it got to be August it occurred to me they might be a little late (!) with that June issue, so I enquired. I am/was a subscriber to AIM also. Their new bimonthly publication Connect, to which I also subscribed, also seems late. The first issue of Connect was June, here is the end of August & I see no 2nd issue. Good thing I'm a patient fellow...

Other than Unicorn's continuing existence in serving as AC's publisher, my personal impressions are that Unicorn/Pegasus has effectively left the Atari world & is branching out into other areas. Just my opinion. I guess I have a lot of mixed feelings about the desth of AIM & stuff, I still haven't assessed all the implications yet.

3245. Atari 8-bit stuff for sale

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-01 00:45:39 UTC
From: dam1@Isis.MsState.Edu
Message-ID: <260rbj$min@Tut.MsState.Edu>
Source record: 105155

I have the following Atari 8-bit items for sale:

Accessories - 1 Suncom Tac-3 joystick $3
1 Atari 7800 joystick $3
1 set of paddles $5

Software on disk - Bank Street Music Writer $5
The Converter version 1.51 $5
Print Power $10
The Print Shop $15

Games on disk - Boulderdash Construction Set $10
Chessmaster 2000 $10
David's Midnight Magic $5
F-15 Strike Eagle $7
Jewels of Darkness $5
Master of the Lamps $7
MRCA Mach 2 $5
Pinball Construction Set $10
Quest of the Space Beagle (no docs) $3
Silicon Dreams $5
Trail Blazer $10

Books - Atari DOS 2.5 Manual, $5
BASIC Computer Games, $5

If you are interested in any of the above please contact me...

>mode begins after 10 min. Since GED is in a DLI all the
>time, the OS VBI routine must be disabled.

Sorry if I confused you. The DLI routine exists just after the last scan line on the screen is completed. The OS VBI executes as normal.

> I have some Steve Dong .obj files (Roxanne, Challenger,
>Desire, CityDemo) that must use DLIs to get all the color
>Mr. Dong got in those pictures.
> I did load some 7680 byte pic files I had into GED. That

>file and adding 320 0's on the end of the file.

If you have the ability to save your raw 7680 byte files out as a binary file with a load address of $6010, GED will load them directly without needing anything else. A future option will import raw data without a load address.

Well, DOS 2.5 comes with a ramdisk installer, looking for any amount over
64K to install it into. There was also SMARTRAM, a BASIC program that
created an executable called RAMDISK.COM, which loads a 1024 sector
RAMdisk for me (I have a 256K system). both are installed as D8:, so you
would edit your program and type
SAVE "D8:COBOLMOD.BAS"
Same as a real drive...

You are correct in that it wont UUDecode for some reason. Well, in my
case, it WILL UUDecode, but the ARC file loses PSI.(whatever) in a failed
CRC check plus whatever else was after that particular file. All I got
was a bunch of sources, which, of corse, I cannot use.
All extender M65.

3254. Need Disk Drive!

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-01 03:07:56 UTC
From: timuszyn@jupiter.cse.utoledo.edu
Message-ID: <1993Aug31.220756.5747@uoft02.utoledo.edu>
Source record: 105157

About two weeks ago, I thought I'd load up an old Atari I had sitting aside for the family... plugged everything in, and hmm... no drive light. Tore into the old faithful 810 and starting testing the components. Looks like the main board's shot. In short, I need to get a hold of one of the old 8-bit drives. I've seen several people selling drives on and off here, but usually I'm too late for the offer. I'm considering an Indus that... hmm... well, someone here was selling (have to check my old mail), but am really looking for an older 810 or 1050 to tinker with.

I didn't plan to spend too much, but the mail here surprised me! Seems 810's are going for about $15-20, 1050's for $20-30, and I even saw an old Percom for $20 I think! I know, I know, rock bottom prices, but I've seen these prices repeatedly from several users! Anyone selling? Even a bit higher is fine... I'll be watching posts... my e-mail's normally swamped so stuff is generally ignored.

Thanks all,

-Tim

PS: Who's this Kamaro_kid? Tried e-mailing, but no response! He had a few things up for sale, but haven't seen him for quite a while...

jking@uxscosv1.asit.utah.gov OR kamaro kid@delphi.com

I've emailed both addresses, to no avail. If anyone knows how to contact either, please email me or post (post preferred)!!!

Hmm, since I've been unable to reach this Kamaro_kid by email, thought
a quick post was in order. (Mentioned it in my last msg to all on the
disk drive topic.)

- - - - - - - - = = = = = = = = - - - - - - - - - = = = = = = = = - - - - - - - - -

Saw this a while ago and emailed, but still have heard nothing, just
checking back:

} From: KAMARO_KID@delphi.com
} Date: 26 Aug 1993 18:56:52 -0500
} Sender: daemon@cs.utexas.edu
} Organization: UTexas Mail-to-News Gateway
}
} I have the following Atari hard/soft/firm ware items for sale or trade:
}
} Hardware
} ##
}
} Atari 1050 w/US Doubler chips $60.00

Just have to ask... this is a bit high even for a few years back, does
this mean it comes WITH a 1050 then? (Is the chip already installed in a
drive for $60? Or is this just for the chip??? (and software and docs))

} Atari 1050 (stock) $30.00

How "used"? Around the block a few times? years? Still in new wrap?

} Atari XEP80 w/software & original packaging $50.00

Is this the 80-column hardware attachment for the older systems? Do you
need a monitor for this? Does it come with any type of word processing
software or ANYTHING that's designed to use the 80-column mode?

} 1 x SyQuest 5meg removable drive w/3 5meg carts $60.00

Need some serious help here... no idea on this one. Does this "hook
right up" somehow (with minor wiring)? Do you need a special DOS? Special
box? (Black box card, ICD... etc.)

} 1 x 1020 printer/plotter w/3 rolls paper $20.00

How many pen sets left with it? One set? Any extra black/color pens?

}
}
} Firmware

} ##
}
} AtariWriter w/manual $10.00

I would be VERY interested in this one if it's the original CARTRIDGE!
I get tired of loading this silly thing from disk all the time, the cart
would help quite a bit!

Thanks again,
-Tim

3257. Drive # switcher!

Date: 1993-09-01 03:43:59 UTC
From: timuszyn@jupiter.cse.utoledo.edu
Message-ID: <1993Aug31.224359.5750@uoft02.utoledo.edu>
Source record: 105168

I saw this over an old friend's house about... ohhhh... 8 years ago. It was some binary or "something" that allowed you to switch drives, reboot the system without clearing ramdisks, etc.

He had a slightly modified 1200xl, loaded up DOS 2.5 I think, copied an entire bootable disk to his ramdisk, hit a couple of the function keys (shift and F2 I think) which changed his ramdrive to D1: passing his physical drive D1: (how?) and hit another set of keys, which did a quick softboot... the system then commenced booting from the ram drive D1!!!

He's also done this for disk editing also... just copied an entire disk to his ramdrive, hit a couple keys to reboot (softboot), and loaded the editor. He could then mess with his "disk", reboot, and recopy the intact ramdisk back to its physical counterpart.

I'd love to do this to an old 1200xl I've got stashed aside. If anything, I use my 800 for it's sound capability, or the 800xl for it's 256k ramdisk. The 1200xl is a project computer I never had time or info to mess with!

Hmm, maybe it's a modified OS? Newell possibly? Anyone heard of such a utility? Anyone familiar with any of the modified OS's for the Atari 8-bit's?

HELP!
-Tim

>I wonder if anyone is going to bother to write a sequel...

>"The Rise and Fall and Rise and Fall of Atari"

Now, BobR... You're being a pessimist. :)

It oughta be pretty clear by now that Atari is gonna be around for as long as the Tramiels want it. The bigger question, or so it would seem to me, is: how long will they stay in the computer making biz or just give up and do what Atari is "supposed" to be doing, i.e., making game systems.

The possible great success of the Jaguar could lead them to staying in the gaming end of the spectrum and giving up on making great computers.

Funny what Americans want today, isn't it? Mediocrity at its very best (MS-DOS computers...) and games games games to keep their mind off the fact that their government is raping them daily?

Oooops. That oughta start a flame series, huh?

3259. Indus GT Synchromesh

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-01 04:27:00 UTC
From: entropy@gnu.ai.mit.edu
Message-ID: <ENTROPY.93Sep1042700@mole.gnu.ai.mit.edu>
Source record: 105169

Greetings all...

I've had an Indus GT drive for a number of years, and I used to use the Synchromesh software to speed things up a bit (once I hacked it with a disk editor so it wouldn't try every drive up to D8:, GTSYNC.SYS became almost useable...)

At one time I received a card from the folks that made the Indus saying that there was a new version of Synchromesh that would load *before* DOS, thus allowing the entire boot process to be speeded up as well.

Unfortunately I put off ordering this new program for much, much too long, and when I eventually got around to it the phone number and address on the card no longer seemed to have anyone on the other end. Is there any way I can get a copy of this program?

Thanks,
entropy

p.s. Email responses are preferred, but I do read this group regularly, so post if you think others may be interested.

Tim asks about custom OS chips.
I'm aware of two. The Newell OSNXL with omnimon and the CSS
US+ OS. It sounds like you're describing the US+ OS.
It allows switching drives and re-booting without wiping out
the RAMdisks, and has a sector editor, I think. Of course,
your friend had to have a RAM upgrade to have RAMdisks.
The Newell OSNXL is a 800 compatible OS that has a built
in debugger/monitor. The US+ OS has, I guess, 3 OSes.
The UltraSpeed OS, 800 fix OS and uses the stock 800xl OS.
The Newell Ramrod board can hold 3 OSes. I presume the US+
OS can't be plugged into the Ramrod board. The US+ OS
features the RAMdisk swapping, editing, UltraSpeed disk
I/O with the Black Box floppy adapter or Super Archiver
1050 upgrade. It (the US+) also has a RAM checker.
The US+ is from CSS at $70 plus $5 ship.
The Ramrod is $49 + ship from Newell.
(See vendor list for phone/addresses)

3262. 1200XL Keyboard pinout

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-01 14:43:32 UTC
From: rdell@cbnewsf.cb.att.com
Message-ID: <CCoJKK.7vu@cbfsb.cb.att.com>
Source record: 105177

OK .. I managed to get some 1050 disk drives and a 1200XL so I can set up a second system, and actually do useful stuff during my prime computing time (after kids go to bed).

The 1200XL has problems though. The keyboard is dead, though otherwise the 1200XL seems in good shape, and cartriges work fine with the joystick.

What is the keyboard pinout? Is it compatible with any other system for a quick checkout? (I had it apart, two chips with the keyboard, the 800XL keyboard has those buffer chips on the mother board, and if memory serves, so does the 400). I have several 400's, an 800, and two 800XLs (one with stuck key) to choose from for debugging. I suspect from the chips that the 1200XL keyboard is unique among these, but with pinouts I can at least probe the keyboard with my oscilloscope.

Now I have another system to check out compatibility problems and find ram disk information for <grin>. As if my disorder wasn't large enough already. I look forward to the info in the Atari Classic series on ramdisks.

3263. 8-bit Atari Frequently Asked Questions

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-01 14:59:59 UTC
From: MCURRENT@carleton.edu
Message-ID: <01H2FHMS6NYA91VYRI@carleton.edu>
Source record: 105171

```
Atari Archive: 8bit/faq.arc

Welcome to the comp.sys.atari.8bit/Info-Atari8 Digest discussion group!

The 8-bit Atari

Frequently Asked Questions List

Revised 31-Aug-93

Additions/comments/corrections having to do with this FAQ List are
welcomed by its creator and maintainer, Michael Current:
Internet: mcurrent@carleton.edu
UUCP: ...!umn-cs!ccnfld!mcurrent
Cleveland Free-Net: aa700

The 8-bit Atari FAQ List is posted on or about the first of the month to
the comp.sys.atari.8bit/Info-Atari8 Digest discussion group.

What is this FAQ List for?
The 8-bit Atari FAQ List was created to provide answers to many commonly
asked questions found in the comp.sys.atari.8bit/Info-Atari8 Digest discussion
group. At this time the FAQ List is heavily geared toward describing the
various resources for the 8-bit Atari user available, with relatively little
information on the Atari itself.
This is not an "official" FAQ List in that it is not cross-posted to the
moderated newsgroups news.answers and comp.answers. (There's no particular
reason for this, I just haven't taken the time to figure out the process yet.)
Hence no automatic archiving of this FAQ List occurs, though there's usually
a fairly recent copy on the Atari Archive (see below) as the file
8bit/faq.arc.

What is comp.sys.atari.8bit?
comp.sys.atari.8bit is the unmoderated newsgroup serving as the Usenet
side of this discussion group. All postings to comp.sys.atari.8bit
automatically appear in the Internet's Info-Atari8 Digest.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid on
comp.sys.atari.8bit.

Other Atari-related newsgroups:
comp.sys.atari.advocacy (pros and cons of Atari computers)
comp.sys.atari.st (ST/TT/Falcon)
comp.sys.atari.st.tech (ST/TT/Falcon technical)
comp.sys.palmtops (includes Portfolio)
rec.games.video.arcade (includes products by Atari Games)
rec.games.video.misc (includes Lynx, "Jaguar")
```

rec.games.video.classic (includes 2600, 5200, 7800)

What is the Info-Atari8 Digest?
The Info-Atari8 Digest is the unmoderated mail-list serving as the Internet side of this discussion group. All contributions to the Info-Atari8 Digest automatically appear on Usenet's comp.sys.atari.8bit. The Digest is maintained by John Dunning, jrd@stony-brook.scrc.symbolics.com.

To SUBSCRIBE or UNSUBSCRIBE to the Info-Atari8 Digest, send e-mail to info-atari8-request@naucse.cse.nau.edu.
To CONTRIBUTE to the Info-Atari8 Digest, send your posting to comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on Usenet's comp.sys.atari.8bit.
Note that any posting sent to info-atari8@naucse.cse.nau.edu will NOT be cross-posted to the Usenet side. John Dunning would like this fixed, but needs help; if you are an accomplished UNIX programmer please contact him.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid in the Info-Atari8 Digest.

Other Atari-related mail-lists:
The Info-Atari16 Digest (ST/TT/Falcon). Send e-mail to info-atari16-request@naucse.cse.nau.edu.

What is the Atari Archive?
atari.archive.umich.edu is an Internet site which contains many files for the 8-bit Atari computers. Our 8-bit Atari Archivists are John Dunning, jrd@atari.archive.umich.edu, and Jody Lenn, lenn@atari.archive.umich.edu. The Atari Archive as a whole is maintained by Jeff Weiner, weiner@atari.archive.umich.edu.

How do I DOWNLOAD files from the Atari Archive?
In one of four ways:
1. FTP (Try the one nearest you first)

a) FTP to atari.archive.umich.edu (141.211.165.41) <--United States
User: anonymous
Password: [your e-mail address]
cd atari/8bit

b) FTP to wuarchive.wustl.edu (128.252.135.4) <--United States
User: anonymous
Password: [your e-mail address]
cd mirrors/archive.umich.edu/atari/8bit

c) FTP to src.doc.ic.ac.uk (146.169.2.1) <--Great Britain
User: anonymous
Password: [your e-mail address]
cd computing/systems/atari/umich/8bit

d) FTP to archie.au (139.130.4.6) <--Australia
User: anonymous
Password: [your e-mail address]

cd alex/edu/umich/archive/atari/atari/8bit

e) FTP to info2.rus.uni-stuttgart.de (129.69.8.13) <--Germany
User: anonymous
Password: [your e-mail address]
cd /afs/umich.edu/group/itd/archive/atari/8bit

Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

2. BART - Brode's Archive Retrieval Thang - the Archive's e-mail file server
To learn about using BART to access the Archive, send e-mail to:
atari@atari.archive.umich.edu. The subject of the message doesn't matter, but
let the body of your message be:

help
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes),
try including a line of this form:

path [your e-mail address]

BART automatically uuencodes binary files (so they may be mailed over the
Internet) and splits up large files into parts of about 30K or less.

3. Gopher
The Atari Archive can be accessed in Gopher. If your Gopher server
doesn't provide a path to atari.archive.umich.edu, try the command:
gopher gopher.ius.itd.umich.edu

4. AFS
If your system has AFS capability, this is the easiest way to access the
Archive. Just cd /afs/umich.edu/group/itd/archive/atari/8bit

How do I UPLOAD files to the Atari Archive?
In one of three ways:
1. FTP
FTP to atari.archive.umich.edu (141.211.165.41)
User: anonymous
Password: [your e-mail address]
cd atari/8bit/New

(No uploads may be made to the Archive's mirror sites.)

Remember to set file type to BINARY when uploading non-text files
(.arc, .com, .dcm, etc.) by FTP. Also, please upload a short .text file
describing what your upload is, so our 8-Bit Archivists will be sure to place
it in an appropriate permanent directory.

Note that the atari/8bit/New directory is "write-only."

2. E-mail
This is a bit slower, but is still very effective.
Simply uuencode the file, (please split it into parts of 60 K or less)

and mail the result to weiner@atari.archive.umich.edu. Please name
the parts in the subject line. This is really helpful as the parts
usually don't arrive in the proper sequence. Also, please include a
message labeled "file transmission," containing a short description of
the file, etc. Shar files are also acceptable, but uuencoded is preferred.
It is especially important to specify that your upload is for the 8-bit
computers, since most of what Jeff receives is for the ST/TT/Falcon.

3. AFS
If your system has AFS capability, this is the easiest way to upload to
the Archive. Just cp the file into
/afs/umich.edu/group/itd/archive/atari/8bit/New

Are there any other 8-bit Atari FTP sites?
Here's another, maintained by Adam Bryant, adb@albert.bu.edu:
FTP to cs.bu.edu (128.197.2.1)
User: anonymous
Password: [your e-mail address]
cd PC/ATARI

Are there any alternatives to BART?
There are two general-purpose FTP mail-servers. These may be used to
retrieve any files available from anonymous FTP sites on the Internet,
including atari.archive.umich.edu.
1) ftpmail@decwrl.dec.com
For information, send a mail message to the above address where the body of
your message says:
help
quit
2) bitftp@pucc.princeton.edu
For information, send a mail message to the above address where the body of
your message says:
help

What is the Cleveland Free-Net Atari SIG?
The Cleveland Free-Net is like a huge public bulletin board system, and it
is the hub system of the NPTN, the National Public Telecomputing Network.
Anyone can access the Free-Net via modem at (216) 368-3888. Those persons
with full Internet access can TELNET (this does not mean FTP) to
freenet-in-{a,b,c}.cwru.edu (129.22.8.38). Applications for accounts
are handled online. Once logged-in, type "go atari" to reach the Atari SIG.
Those who add their names to the Atari SIG user directories are automatically
members of the official Atari user group CAIN - Central Atari Information
Network. Send correspondence and press releases to xx004@po.cwru.edu.

What print magazines support the 8-bit Atari?

What product developers or vendors support the 8-bit Atari?
See the companion frequently posted text file, "All Known World-Wide 8-Bit Atari Vendors and Developers" for complete information. This file is posted to the comp.sys.atari.8bit/Info-Atari8 Digest discussion group on or about the 15th of the month. There's also usually a fairly recent copy available on the Atari Archive as the file 8bit/faq2.arc

What's this UUEncoding stuff (.uu, .uue files) all about?
UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. On the Atari Archive:

Uudecode 1.2a by John Sangster - very functional. Archive filenames:
8bit/Archivers/uudecode.bas - just ENTER this into Atari BASIC
8bit/Archivers/uudecode.doc - the User Manual

Yet Another UU-coder by ?John Dunning? - both decoding/encoding. Filename:
8bit/Archivers/yau.arc - contains both yau.com and yaue.com.

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use." Filename:
8bit/Utilities/uue.arc - contains uudecode.com, uuencode.com.

Dumas UU-coder by John Dunning - should work w/BART-style split files. Fname:
8bit/Cc65/dumasuu.arc - contains uud.com, uue.com, CC65 sources.

What is an .arc file?
A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The Atari Archive contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended. Filenames:
8bit/Archivers/superarc.arc - both Super Un-Arc and Super Arc
8bit/Archivers/suprarc2.arc - just Super Arc
8bit/Archivers/supunarc.com - an un-arc'd copy of Super Un-Arc
8bit/Archivers/supunarc.uue - uuencoded copy of supunarc.com

Okay, how about a .dcm file?
A .dcm file is a format unique to the 8-bit Atari which is used to convert
entire disk images into files. To work with .dcm files you'll need:

Disk Communicator 3.2 by Bob Puff. Archive Filenames:
8bit/dskcom32.arc
8bit/Archivers/diskcomm.arc

Can I read/write 8-bit Atari disks on an IBM-PC?
There are several programs on the atari.archive of this variety. Note
that most require a DOS and disk drive on the Atari end capable of the SS/DD
180K format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs are:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
8bit/Diskutils/atario21.arc

Mule by Rick Cortese - Reads/Writes SS/ED 128K Atari disks. Very limited.
8bit/Diskutils/mule.arc - includes Atari Mule; Action!, Turbo C sources
8bit/Diskutils/mule.exe - IBM Mule
8bit/Diskutils/mule.txt - descriptive blurb

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks. Filename:
8bit/Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Quite popular.
8bit/Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

What's the best DOS for the Atari?
This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2D is disk-based; SpartaDOS X is cartridge-based and includes many additional features. While it's hard to argue that SpartaDOS X is not the most advanced DOS available, it is a commercial product that is no longer manufactured. MYDOS, on the other hand, is a shareware product that continues to be improved upon.
It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. MYDOS is available at the atari.archive.

What are the best telecommunications programs available for the 8-bit Atari?
Here are some of the more popular PD/shareware terminal programs available on the Atari Archive:

BobTerm by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Archive filename: 8bit/Telecomm/bterm12.arc

Kermit-65 by John Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Archive filenames:
8bit/Telecomm/k65v37.arc - the latest version
8bit/Telecomm/k65doc.arc - the documentation
8bit/Telecomm/k65src.arc - the source code

OmniCom by CDY
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Archive filename: 8bit/Telecomm/omnicom.arc

VT850 by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: none
Autodial: No
Archive filename: 8bit/Telecomm/vt850b1.arc

What hardware has Atari created in the 8-bit computer line?
Computers:
400 (1979) 8-16K, membrane keyboard, 400/800 OS

800 (1979) 8-48K, two cartridge slots, 400/800 OS
1200XL (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL (1983) 16-64K, BASIC, PBI, XL OS
800XL (1983) 64K, BASIC, PBI, XL OS
800XLF (????) ?????, a U.K. variety...
65XE/800XE (1985) same as 800XL minus PBI
130XE (1985) same as 65XE with 128K plus ECI
XE Game System (1987) same as 65XE plus Missle Command, detach. keybd.

Peripherals:
410 Program Recorder (Japan and Hong Kong versions)
810 Disk Drive SS/SD 90K with DOS 1 or DOS 2.0S, MPI&Tandon vers.
820 Printer (40 col.)
822 Thermal Printer (40 col.)
825 Printer (80 col.), req. 850
830 Modem (300 baud acoustic, req. 850, with Telelink I)
835 Modem (300 baud, with Telelink II)
850 Interface Module (4 9-pin serial, 1 15-pin parallel ports,
beige & black metal versions)
1010 Program Recorder (Sanyo and Chelco versions)
1020 Printer/Plotter (print/draw in 4 colors)
1025 Printer (7-pin dot matrix, 80 col.)
1027 Printer (80 col., letter quality)
1029 Printer (7- or 9-pin??? dot matrix)
1030 Modem (300 baud, with 1030 Express!)
1050 Disk Drive (SS/ED 128K with DOS 3 or DOS 2.5)
XC12 Program Recorder
XM301 Modem (300 baud, with XE Term)
XMM801 Printer (80 col.)
XDM121 Printer (80 col., letter quality)
XF551 Disk Drive (DS/DD 360K with DOS XE)
XEP80 Interface Module(80 col. video display and DB25 parallel port)
SX212 Modem (1200 baud, rarely with SX-Express! package)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 2 x SS/DD 180K with DOS 2.0D
1064 64K RAM module for 600XL
1090 XL Expansion System, for PBI, CP/M/MS-DOS/Apple II compatible
XM128 12" green monitor w/ built-in 80-column card
XC1411 composite 14" color monitor
XF521 5.25" floppy drive - 1050 compatible, in XE style
XTM201 non-impact printer
XTC201 non-impact color printer

Where is my nearest 8-bit Atari user group?
Where is my nearest 8-bit Atari BBS?
Lawrence Estep at Atari Classics magazine maintains lists of 8-bit Atari
BBSs and 8-bit Atari user groups, each of which is too long to include here.
Contact him at 71450.1050@compuserve.com.

3264. Re: ATARI Laser Disk Interface

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-01 15:19:23 UTC
From: aa700@cleveland.Freenet.Edu
Message-ID: <262ehr$odd@usenet.INS.CWRU.Edu>
Source record: 105172

In a previous article, meyer%nyneve.dnet@delcoelect.com () says:

> In recent discussions with a collegue, he had come across a console that
> interfaced an ATARI 800 with a 12 inch LASER disk, stereo sound system,
> color monitor, and a floppy drive. The entire system was contained in a
> rack mount cabinet and looked like it was used for a store demonstration
> of the ATARI 800. The interface between the laser disk and the 800 was a
> box with a silk screen label "ATARI LASER INTERFACE BOX" on the cover that
> plugged into the 800 SIO port. The box is about 8-1/2" x 12" and comes with
> a floppy disk to boot the system labeled "ERIC BOOT DISK". After the system
> was booted from the floppy, you could call up games, music, and demo's from
> the laser disk. It also had the capability to overlay the ATARI graphics
> over the laser disk picture. My question is does anybody know anything
> about this system - especially documentation, schematics, ect. I assume
> this was put together around 1985.

If this was really used for a store demonstration for the 800 it is
probably older than that, since the 800 was discontinued in 1983.

I've NEVER heard of this Atari Laser Interface Box--if you or anyone else
can tell us anything more about it, please do!

3266. Indus GT Drive schematics wanted

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-01 16:15:55 UTC
From: meyer%nyneve.dnet@delcoelect.com
Message-ID: <9309011603.AA11646@koedgw01.delcoelect.com>
Source record: 105174

I recently purchased a Indus GT drive but no documentation came with it.
I contacted Best for their 100 page documentation package listed in their
catalogue and found they don't have any more copies. They won't make any
new copies unless they could be sure of selling all of them. I was wondering
if someone else out there that has this manual, could make a copy and send
it to me?

Thanks,
Marc Meyer

|>

Sounds like your friend had the US+ OS from Computer Software Services. It allows you to go to a configuration menu, swap the drive numbers around, and do a soft boot from the RAM disk. It's been written up in one of the columns in the first 2-3 issues of Atari Classics magazine. I have a US+ OS in my 800XL, and it's great!

3269. Atari 8bit items (including color monitor, printer, more) sale

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-01 22:00:51 UTC
From: cohen@GOMEZ.phys.virginia.edu
Message-ID: <00971E7A.6500BE60@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 105178

The following "stuff" (hardware, software, books) will be sold to best
(reasonable) offer. Please pick up any items you are interested in,
there is NO need to buy everything!
Please e-mail offers to COHEN@BORN.PHYS.VIRGINIA.EDU , or call (804)293-8973
late evenings in case you have no e-mail account (prefer e-mail, please).
I will respond to every e-mail message I get here (if you get no response,
please try again). PLEASE FEEL FREE to make any offer! I hope to finalize
sales within a few days, and will accept immediately offers that look very good
(if there will be any).

Thanks!

***** HARDWARE *****

Except where otherwise notes explicitely, all hardware was in working condition
when used last (I no longer have the Atari computer to test it now).
When problems are known to exist, details are given.

Printer- Gemini-10X (Centronics parallel standard interface, for use with Atari
850 unit and parallel cable sold below or equivalent)
Monitor-
1. Green monochrome monitor, composite video, no sound, excellent for
80-column work, text-intensive applications and BBS. Picture on
this monitor is MUCH sharper than any color monitor will provide.

2. MAGNAVOX RGB- MONITOR 80, with
Composite AND RGB CGA, both color and green monochrome modes.
The model # is CM8562 074G.
This monitor has composite color input, Audio input,
RGB TTL (CGA video) input,
CVBS/VCR button, and is dual mode
color/green monochrome push-button switchable.
This is useful for VCR, computers with composite output,
CGA as well. Good for 80-column applications.

Atari CX853 16K RAM memory module for Atari 800
Axlon RAM CRAM 32K memory module for Atari 800
Modem cable (to any RS232 modem) for Atari 850 unit
Parallel (centronics) printer cable for Atari 850 unit
MPP CARD?/AT centronics parallel printer interface (hooks up a standard parallel
printer to Atari I/O port, no need for 850 unit).
Atari power supply model # C061982 (for the XL/XE series I think).
Atari 1027 Letter Quality printer almost new, in original box, with manual,
but does not work properly
Atari 1020 color printer/ plotter with manual.
Another Atari 1020 Color Printer/plotter with manual, this one need work

on print spool
Atari paddles
Joysticks- various types and shapes, all tested and working well.
Atari 1030 Modem with manual
Taihaho Direct Connect 300/450 baud modem model TH-003 autodial/auto answer
(I think this connects to the joystick port)
Atari 410 Program Recorder (the original one).
Atari 1010 Program Recorder - I have 2 units, Work fine.
Atari 1010 Program Recorder - save: ok, load: no.

4 DISK DRIVES-
2 Atari 1050 drives, 2 Atari 810 drives, all sold as is.
They had various levels of problems, the 1050 spins and the light comes up
but it won't load, and one 1050 and one of the 810 were dead as I recall.

***** SOFTWARE *****

Cartridges-
==========

Asteroids
Pac-Man
Space Invaders
BASIC (CXL4002) with manual

Disks- (All are original disks)
======
TimeWise with manual and original box
Epyx Summer Games with manual and original box
Strategic Simulations Inc. Computer Baseball with manual and original box
Sargon II with manual and orginal box
Music Construction set with original binder and manual
Pinball Construction set with original binder and manual
Infocom Zork I with manual and original box
Micro League Baseball with manual and original box
Micro League Baseball General Manager/Owners Disk with original box
Atari Translator
Ghostbuster by Activision
CONAN (Datasoft)
Computer Baseball
Atari program Exchange (APX) ATSPEL/AT.WRIT.-program 1.0, by R.S. Kistler
Atari program Exchange (APX) ATSPEL/AT.WRIT.-dictionary 1.0, by R.S. Kistler
Atari DOS 2.5 with manual

plus about 100 generic disks with shareware, and many types of programs
(word processors, terminal emulators, utilities of all sorts, games, etc.)

Cassettes-
==========

Joystick Sketchpad with manual (new, sealed)
apx Eastern Front 1941 (with manual and original box)
Thorn EMI Compute 4 and Reversi (in original box with instructions)

Thorn EMI Snooker and Billiards (in original box with instructions)
Atari Statistics I (with manual and original box)
Atari States and Capitals (CX4112)
Atari Hangman (CX4108)

Books-
======

Bill Carris- Inside Atari BASIC
ICD SpartaDOS Construction Set
Your Atari Computer
Computers for Kids- Atari edition
Albrecht, Finkel and Brown- Atari BASIC- XL Edition

Please e-mail offers to COHEN@BORN.PHYS.VIRGINIA.EDU , or call (804)293-8973
late evenings in case you have no e-mail account (prefer e-mail, please).

3270. Re: How to use 130XE RAM Disk

The best thing to do is get a RAMDISK.@OM file (like for Atari DOS) or use the RD*.@OM files in SpartaDOS, or just use (THE EASY TO USE, AND I LOVE IT!) MyDOS (tm! haha)

Sorry.. I happen to love MyDOS.

I've got MY MyDOS set up for 192k RAMBO xl, so whenever I boot it's there, all I do is Format it and @opy DUP.SYS to it so I <an jump to DOS qui<ker.

If your an atari DOS fan, get MyDOS.
If your a SpartaDOS fan, use on of SD's RAMdisk handlers.

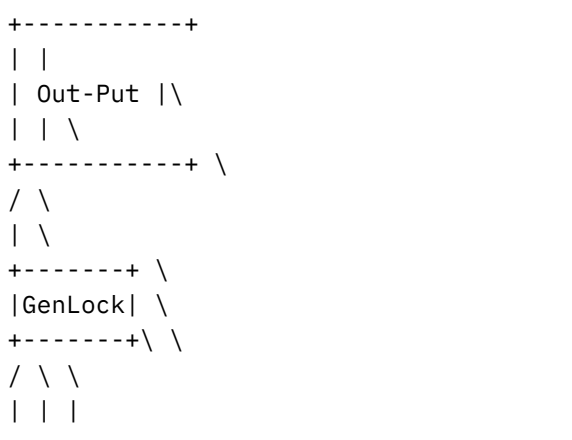
3271. OH MY GOD, AM I NUTS!?

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-02 03:45:27 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <gmD99B1w165w@cyberden.sf.ca.us>
Source record: 105186

Think about this 3-CPU (256k RAM per system, at least - for use as RAMdisks) setup for an "ultimate" game, using >4096 colors, 8 voice digitized sound/music, and 2-layer scrolling!!!!!!!!!!

Hardware:

(A "|" denotes that the line is going outwards.)



Use .RGB'd Interface Play pre-
ColrView with other processed
background CPU's via (converted
(fine scrol- stick port to 4bit)
led and read or SIO. digitized
one vertical Interface sound
line at a with player tracks via
time, which via stick Gate-
is how RGB's port and/or keeper's
are compres- keyboard. player.
sed.) Play digit-
ized sound
effects via
Torsten's

4-voice
digitized
sound play-
er.

So you get 4096 color background, whatever for the forground, 4 voice digitized backgroud music, 4 voice digitized (or whatnot) forground sound effects..!!

I figure that to do I/O you go:

Port A - 4 bits + Firebutton + Paddle0 = Joystick (1 or 2 buttons)
Port B - 2 bits for sound + 2 bits for graphics

Bits would be (00, 01, 10, 11 = 0, 1, 2, 3):

Bit - Sound Graphics
00 Title Music Title scn
01 Next song Next scn
10 No Music No screen
11 duhh....!?

HAHAHA!

Anyone up to it!? HEHEH! It'd actually be pretty simple. As described in the figure, it's like this:

Main Console - Read sticks - Play Digisound - Control Game - Scroll Forground - Talk to other computers
Video Console - Load and scroll background ColrView images
Sound Console - Load and play 4-voice MOD (or MOD-like) sound (music) files

The Main Console's Sound would be Spliced with the Sound Console's sound
The Main Console's Video would be Genlocked with the Video Console's background!

I've had ideas like this before, but this was pre-Torsten Karwoth's 4-voice digisound
player (in MegaBlast I)
and pre-Gatekeeper's MODPlayer

So now I've sorta "upgraded" the idea by adding the "ultimate sound" as well as including a nice GenLock for dual-video!

HAHA!

Just thought that you might like to know that even though the 1400xl and
the 1450xld were never released (along with plenty of other things),
prototypes do exist and people actually own them. I have talked to one
person on GEnie who has quite a collection of Atari vaporware.

I would bet it is a ST506 interface, as that was SASI, the
predecessor of SCSI. Back in the mid 80's I knew a couple
of people who got hard drives working on ATRs via that, but
you would need the Trantor bios extensions to make it work.
Sorry, but I don't have any more info than that, because I
never had a hard drive working myself, just 4 8" floppies.

Its a "cult" thing like the Rocky Horror Picture Show. Something to
do with wanting the prestige of owning a PC of some kind, but not wanting
to have to actually use it. So, they pay lots for a computer that has no
worthwhile software available.

3280. DGS update

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-02 19:12:24 UTC
From: djg0@aberystwyth.ac.uk
Message-ID: <9309021900.AA23268@deca>
Source record: 105189

D.G.S. Update

Well, it's been 9 weeks now since I formed DGS, so I thought I'd just post an update to tell you what has happened since.

Grant - After visting my local Enterprise Agency I applied for a European Community grant to help run DGS for the first year. After writing a very long and detailed business plan, the EC awarded DGS a grant, which is worth 2470pounds over a 9 month period. This is currently keeping DGS alive. Many thanks to the EC!

Sales - sales have been very very dissapointing so far. I am barely making enough to cover advertising costs, and other costs associated with running a business that many people just don't think of, like printing costs, professional fees (accountant, etc.), stationary, telephone, etc. The only way I can keep DGS alive and kicking is for an increase in orders. I mainly sell within the UK, but I also sell to other countries as well. I am not allowed to sell PPP products outside the UK, but I will sell PD software and the News-Disk to other countries. To make this easier, I accept payment in cash in US$. That means no expensive IMOs! Other countries should pay in cash in UK pounds Sterling, or by an IMO in pounds. PD software is quite reasonably priced, and can cost as little as $2.50 a disk if you order 20 disks or more. Most of the PD disks are double sided, so you get real value for money! A shipping charge of 10% of the order value (minimum $5) is charged on your order. But, see details of our special offer later in this posting!

New products - DGS is looking for new products for the Atari, and we have found some, or they found us in fact! There is another company in the UK which publishes software for the Atari, called RAMBIT. Their main product is a hardware upgrade for Atari data recorders (1010, XC11, and XC12) that allows specially converted tapes to load at up to 3500baud! I have one of these devices fitted in my 1010, and it really is impressive. However, they also used to publish some software as well, but stopped doing so many years ago due to high advertising costs. RAMBIT phoned one day and said "hey, do you want to re-publish some of our software". "Why not!", I replied! The two products we are currently re-working are called Print-Filer and TaskMaster. Print-Filer is a very techno piece of kit for printer users. Basically, you load in Print-Filer and then load in your word processor or DTP package or whatever, and Print-Filer then sits in the background until you select to print. At that point up pops a menu allowing you to print as normal, or re-direct it to a disk file. A special editor then allows you to mix outputs from lots of different packages together into one file, which can then just be printed from DOS! Perfect for letterheads and such like. And, for all you print shop users, a special version of Print-Filer allows full compatability

between P-F and print shop (the standard version of P-F will only work with packages using a max. of 48K). I have just finished re-editing the manual for P-F, and we should have it on the market very soon. The UK price will be 4.95 (pounds). I will probably be selling it direct to the U.S. from here in the UK, but only if there is any interest in such a product. E-mail me if you would like to see P-F available in the U.S. TaskMaster is a tape to disk convertor, so probably won't be of much interest to U.S. users.

Special offer - if you have read this far, then you are in for a treat! For your first P.D. order from us, you will pay just $2 a disk if you order a minimum of 10 disks (+10% min $5 shipping). And, if you order 15 or more disks, then we will pay your shipping! That's right, 15 P.D. disks for just $30 inc. free shipping! We currently have 166 disks to choose from! All you need do is quote this reference when ordering: NET93.

Our Catalogue - you will, of course, need a catalogue! A catalogue is available from us by sending US$5 in cash. A catalogue will be on its way to you the very same day your $5 arrives! Other countries send 3 IRCs. Send direct to:

Yes, the XEP80 is the 80 @ol devi<e. It "wants" its own monitor. I
believe only Mono monitors work REALLY well with it. You @an no doubt
make a swit<her, I guess.

BobTerm works with it as-is (just install the XEP BobTerm ditty..)

> } Firmware

>

Well, MyDOS allows you to name the RAMdisk as ANY drive (1-9), so if you
go:

[S]et RAMdisk "1"
[1]-dir of D1:*.*

you'll get the RAMdisk

if "D:" is = to "D1:", then it's the same thing when you talk to the
"D:". Ni<e, unfortunately, I @ouldnt get MODPLAYER to believe it as it
prob. has it's own "built-in DOS" @ommands!?

anyways.. this most likely is OS or hardwired, as the OS boots from D1:
only.. it doesnt KNOW what a Ramdisk is UNTIL DOS is loaded AND a RAMdisk
handler (if not built in) is loaded...!!

>

Not exactly. There is an excellent spell checker that works with
the cart-based AW. It was sold by the Atari Program Exchange (APX).
I think it is called ATSPELLER for AtariWriter. I don't know where you
could get a copy now, though. It is an AUTORUN.SYS file that loads
with the AW cart and provides a new menu selection letter ("A" I think)
to run it. The only problem is that the menu itself is not modified
to show this, so you have to remember it. Works especially well with
a 2-disk system -- one drive for your working files and one for the
dictionary. They managed to fit an amazing number of words onto that
SS/SD 88K floppy.

Hello,
Long before I even knew about the book "Zap! The Rise..." I had lans about writing a book called "The Rise and Fall of the Atari Empire." Now, it looks like I might actually get around to it. If anybody is interested in helping me out on this project, please email me a tim@rider.cactus.org along with any information. Any sources would most definitely be credited...including the older book...now if I could only get hold of one...

This is not a commercial post, i am a collector... Mostly of classic
videogame systems. Please save your flames :)

I place of posting my 500+ line list to this newsgroup, i would ask ANYONE
who would like a copy to reply to my above mail address, you will receive
an immediate reply.

My extras list over 500 hardware/software items from these groups:

Atari 2600 Atari 5200 Atari 7800 Atari 400/800/XL/XE
Colecovision ADAM Intellivision TI 99/4a
Timex Sinclair Vic 20 Commadore 64 Commadore +4
Odessey2 Super NES Classic NES Gameboy
Sega Master Sys TurboGrafx 16 Actionmax VHS Radio Shack TRS-80
Bally Terminals Joysticks Associated Books/Manuals

PC Software/Hardware Misc computer equipt/parts

A copy of the list can also be found in the appropriate newsgroup misc.forsale.

A list of wanted items I would also consider trading for is also included.

Thank you for your time.

Steve

about it so I picked it up at the library.

UGH! Not only is it a bad book (VERY poorly written) but it doesn't have ANY real sort of analysis or thought. I mean "East of Eden" (the book about Apple, not the classic) is disparaging of Apple (which is a whole 'nuther topic all together: I mean where do these writers get off? They could have done it better??!?!?) BUT it at least gives you some juicy tidbits and an insight into Apple and the times it prospered and dwindled.

BUT, if you have a halfway decent library AND you have about an hour to kill (I mean it, it is large print and almost double spaced!) you should pick it up and see what I mean. It is almost not worth the effort but reading IS fundamental! :-)

I just recently picked up a copy of SIO2PC 3.03 off of a.a.u.e, and it's a MAJOR improvement over the 2.5 version I did have. However, I'm wanting to ask a couple questions as well as make a couple suggestions. If I can't reach him electronically, I'll have to put a letter in with the shareware fee. I was just hoping to get a faster response. So, if you're in here, or if anyone who is in here can reach him, please let me know.

Thanks a bunch!

B & C Computervision lists it in the latest catalog I have (Winter 92)
for $7.99. There are 2 versions listed--APA191 ATSPELLER, REV 2 &
APA262 ATSPELLER FOR ATARIWRITER. They also have for Atariwriter
APA223 ATARIWRITER PRINTER DRIVERS. If you buy 10 or more APX classics,
the price drops to $4. Their phone # is (408) 986-9960

Six months or more ago someone wrote a letter to The 2600 Connection claiming to be a long time authority on the history of video games. Supposedly, he has written a tome called something like _Phoenix: The Rise and Fall of Video Games_ and is currently looking for a publisher.

> Its a "cult" thing like the Rocky Horror Picture Show.

I think it's mostly because Apple *still* sells Apple IIe's and
charges exorbitant prices for them. This keeps the prices high
in the used computer market.

The reason for the high prices of new Apples is most likely because
Apple doesn't want to attract new people to their 8-bit line. They
also sell to schools who probably won't flinch at $600 price tag as
much as invidual consumers.

From: staffan@ca.serum.kodak.com
Message-ID: <1993Sep3.175053.16590@clpd.kodak.com>
Source record: 105108

(Whew - terrible luck with posts going off to the bit-bucket this week. With my luck, several versions of this post will all appear at the same time :-). Sorry if that happens!)

I recently acquired an Atari 800, a 1010 program recorder, a Microbits Peripheral Products MPP-1000c modem (no 850 interface needed) and assorted cartridges, including the Basic Language. I'm fairly UNIX and Internet literate, but fairly DOS (and completely Atari) illiterate. I've read the FAQ, and have been poking around some of the ftp sites (from my UNIX world...) Now I think I could use a little hand-holding, to get me over the start-up hump, if someone's willing.

I could snag software from the ftp sites, and bring it onto my Sun, but what's the best way to get it to the Atari? The MPP modem documentation says that it supports upload/download from "Atari bulletin boards", but I don't know how or if that translates to the Internet. Can I get started with what I have, or do I need a few more things first (e.g. a disk drive?, DOS?). If I need additional start-up software, what's the best way to get that - have somebody put together a cassette for me?

I think the novice nature of my questions is probably clear. If anyone is willing to offer a little assistance, I'd sure appreciate it!

Ken

3297. ATW80 Auxiliary menu kudos

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-03 22:01:39 UTC
From: ab588@yfn.ysu.edu
Message-ID: <268es3$e6f@news.ysu.edu>
Source record: 105105

I recieved the August AC last week and was delightfully surprised
to see Jeff McWilliams' article on ATW80 Auxiliary Menu.
Jeff get's the AT-A-WAY! award from me and Youngstown Freenet's
8bit people.
Jeff==> I'm one of those eager-beaver types you mentioned in the
article and don't want to wait til Oct. to get my AC disk.. Where
can I get this baby?????
Ben==>In the article written by Stephen Wallace on Atari Classic
Desktop Publishing he mentions that the authur of Dot Magic is
unknown all exept for the name "Cryptic Wizard" given in the docs.
The author is Chet Walters of Non Standard Magic Software, 930
Churchill Rd. Girard, OH 44420-3308 (about a mile from my house)
Now the company☐ is called Wiz Works specializing in Atari ST graphics
works.
Dot Magic was written before Daisy Dot II. Chet was so taken by
Roy Goldman's efforts in Daisy Dot I came up with the menu driveDot Magic. Mr. Walters 1st called his program Daisy Dot II but
after "some words" with young Mr. Goldman renamed it Dot Magic.
The article didn't tell of the best features of Dot Magic like
the menu driven label maker and you don't need to right a file with
a word processor either. Its a 2 menu program the main menu calling
up sub programs 1-> the document writer; 2-> the typewriter; 3->
the label maker; and 4-> picture formatter/printer.
I find Dot Magic alot easier to use than any of the Daisy Dot programs
including Daisy Dot III.
If only Mr. Goldman and Mr. Walters would have collaberated maybe
they could have come up with a REAL Desk Top Publisher for the 8bit.

The 1200xl keyboard is different (the best of the Atari 8bit
keyboards, IMO). Way back before Atari Interface Magazine was AIM, it
was Michigan Atari Magazine (I think). MAM printed an article once
about replacing the keyboard of any Atari 8bit with the 1200XL
keyboard (which was apparently available at Radio Shack at the time).
I think I have a copy of the article somewhere. It has pinouts for
everything.

Funny how dictionaries got the definition of that
wrong.

acronym - n. A word formed by combining initial letters
(Eniac, UNESCO) or syllables and letters
(radar, sonar) of a series of words or a
compound term.

IMHO.

Well it depends - read the message header outloud, is the subject line
"Regarding: im-ho" or "Regarding: I-M-H-O" If you said the latter when
you read it outloud, then he has a point: IMHO is not a word. The dictionary
definition *you* stated said it had to be a word - if you use it like a word
and not an abbreviation then you're right. If you're like me, or presumeably
as Simon did, and see four letters next to each other, but not an actual
legitimate word, than it is not an acronym. It is just a small shade of
a difference in meaning which seperates an abbreviation from an acronym. To
be honest I can't use 'IMHO' in a sentence as I would any other word,
like 'laser'... or at least not when speaking, to me it is not a word, and
subsequently not an acronym.

maybe you interpert the dictionary different, :)

Since we are talking about a subject that is predominantly
linked with computer usage, praytell just how you see
assemblages of letters such as RAM, ROM, DOS, OS, et cetera?
I hope you don't use these words by pronouncing each individual

letter; are-a-em, are-oh-em, dee-oh-ess, oh-ess.
If you do, you must be one boring person to listen to! ;-)

As for IMHO, I've never seen it outside of my monitor screen,
but I would bet that most people when reading it say it as it's
spelled - im-ho, it's that common. Now assemblages like
ROTFLMAO are something else entirely, they merely register on
the brain for a fleeting moment (once one understands the meaning),
but I still say rot-full when I see ROTFL. Simply a matter of
economy and common sense unless you work for some bureaucratic
government agency that prides itself on how many useless acronyms
they can think up to confuse and deceive the average citizen.

And besides, where would we be today without such greats as
SNAFU (sna-foo)?

snafu - slang adj. In a state of utter confusion.
-fued, -fuing To put into confusion.
[Acronym for "Situation normal, all *fouled* up"]

> If you do, you must be one boring person to listen to! ;-)

I do say oh-ess.. and have never heard anyone say 'os', it would be plain silly.. like with IBM's OS/2 operating system... But yes the others words I say as they look, because they look like words, to me IMHO just doesn't like a word; maybe largely for what you do below with the longer abbreviations I see it is a conglomerate of letters, not a word. That is my point, it doesn't look like a normal word for my speaking language [English] so I don't say it as one. Even when dealing with my old 800, when I upgraded to Rev.B OS, every dealer I talked to called it Oh-ess.. I have never heard 'os' pronounced as a word in 14 years of using computers. DOS -yes, OS -no.

> ROTFLMAO are something else entirely, they merely register on
> the brain for a fleeting moment (once one understands the meaning),

This is the difference between me and you, I see IMHO in the same sense as you see ROTFLMAO, a group of letters it is translated.. but I don't think of it as something that can exist as an English word.

> And besides, where would we be today without such greats as
> SNAFU (sna-foo)?

Like I say, most acronyms that look like words in our language, I say them that way, I even mentioned saying 'laser' in my original message. I in no meant to imply that I spell acronyms, I was trying to define that this is the basic difference between an acronym [makes sense as a word], and an abbreviation [makes sense as letters]. Abbreviations, you spell, and acronyms you stumble over phoenetically.

To bring this back to the Atari newsgroup, I ask how do you pronounce such terms as DLI, CPU, ST?

Whereas how you prononce things like POKEY, should be self-explanatory.

I argue that POKEY, or BASIC, or something is an acronym, CPU, ST, and others because they are most often looked at as just letters [you are not going to tell me about your c-poo?!?!], and are abbreviations.

[What does POKEY stand for anyone, I remember GITA, but not that one...?]

-Kevin

3313. Re: Gemulator 3.0!

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-05 07:38:27 UTC
From: gfrajkor@superior.carleton.ca
Message-ID: <CCvEK3.Iow@cunews.carleton.ca>
Source record: 105122
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

All this arguing over personalities of Darek and his critics gets no one anywhere. And a list of the shortcomings of the Gemulator compared to a TT or a Falcon also gets you nowhere.
Take the device for what it is and look at how useful it can be. In one box, former ST owners get their same old machine only twice as fast. And they get a 486 on top. What have the lost? If you don't play games (I don't) or music (I don't) the extra features of the Falcon or TT mean nothing to me. The extra screen resolutions of a SuperVGA etc., system are important. So is the ability to use the best of the old ST software at double speed.
There is nothing in this but pluses. Once upon a time, I bought the ST partly because it could also run IBM software if I needed it (PCDitto) and Mac software if I needed it (GCR). the IBM emulation turned out to be not so good. Awfully slow. But now, a 486 gives you full IBM speed and double the old ST speed. What's the beef? If Dave Small were smart, he would licence GCR technology to Darek and the MSDOS machines would be what I wanted in the first place -- no hassle access to many OS systems, at no speed penalty.
Or maybe Darek and Small should form a joint company.
why are we knocking good ideas? Someone who Already owns a complete system isn't going to buy a whole other one justget a midi port.

I have an atari 800 system that I would like to unload.

The atari 800 system includes
48k memory
joystick
games: miner49ers and millipede
basic lang. cart.
1010 program recorder
seikosha gp-100 graphics printer
owner's and programmers manual
accessories required to operate the system like
power supply, TV adaptor, etc...

Everything listed here works.
Also the system was sparingly used.

Iam asking for $75 or obo + you pay shipping.
Transactions will be made via COD.

If interested please reply to hhc41396@uxa.cso.uiuc.edu

3320. ICD, etc...

(this is in part from a string of messages about a month ago about micro-miser. sorry for the delay!)

I have been reading about Ben purchasing the rights to a piece of software. Personally I think it is a very good idea. Why do people pounce on others for doing something that is not selfish(profit)??? What he is doing is getting the software so that he can modify it to his needs and also letting others have a chance to use more software (that you really can't find) on our 8-bit machines. He may sell some, but it wont be near what he paid for it.

What I would love to see, is a group of people buy the left over inventory of ICD and give others a chance to use it. It probably wouldn't make a profit but at least for me it would be a learning experience. I would be able to learn how to run a computer business, no matter how small it is.

There are a lot of software and hardware companies that do not support us any more, and that might be willing to unload their products cheap. The hard part is finding people to do this, one person cannot do it alone. Any comments?

I have been looking for a disk drive (810 or 1050) here in Germany for a while.
But it seems to be that it is very difficult to get one.
As I have often seen stuff for sale in this newsgroup I am trying this way now:

Is there anybody selling me any atari disk disk drive to Germany?

Please email me.
Thanks,
Frank

Strings. Pain in the rear, but still fun.
Same with variables.

Everything anyone ever wanted in a program.

OK ATTENTION - MY POINT ARISES:

WHO OUT THERE USES LOTS OF PAGE-6
BASED ROUTINES (other than in
BASI@ or in their own programs).
AN EXAMPLE IS THAT HAPPY@UR.@OM
PROGRAM- it uses page 6 as a data
area. (My question should be more
"Who out there runs programs that
use page 6 a lot")

hey, page 4 for that matter...!? :)

thanx... just @urious. Also mention if you use a RAMdisk or
hard drive, and what DOS you use the most

THANX again!

Have a hard drive for your 8-bit, or looking for parts to build one?
Read on!

For sale:

Adaptec 4000a controller. Converts up to 2 MFM hard drives to SCSI.
Adaptec 4070 controller. Converts up to 2 RLL hard drives to SCSI.
Xebec 1410a controller. Converts up to 2 MFM hard drives to SASI.

As far as I know, they all work ok. It's been a while since I used
them, but they are all in good condition. Take all 3 of them for only
$40! If you're interested, send me some E-Mail.

3324. Remote fileserver for an Atari?

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-06 13:05:39 UTC
From: eyvind@Lise.Unit.NO
Message-ID: <26fcj3INNevu@flipper.pvv.unit.no>
Source record: 105135

Well, I FINALLY got my own Atari, but I have a storage problem... No tape, no disk drive, nothing. I was wondering how hard it would be to use my Amiga as a fileserver for the Atari using the I/O port on the XE/serial or parallel port on the Amy... I could probably manage to write the software for both sides (device drivers for the Atari... THAT takes me back :), but first of all I need to know if it's at all possible, and if so what the pinouts of the IO ports are etc. I know how to use a soldering iron also, in case it can't be done with just a simple cable (keep it simple, though :)

I'm not talking about a null-modem hookup here, but a real device (virtual device? Hmmm...) which reads/writes from/to the Amiga.

If something like this already exists, I'd be glad to hear about it. And, o'course, I'd be happy to work along with someone alse, maybe try and get it working on several platforms (if possible).

Thanks in advance :)

Why don't you just buy a disk drive??? They don't really cost that much and it would be a lot less of a hassel. I think Steven Tucker has a couple to sell.

Well, I thought about that too, but that's the WIMPY way out ;) Besides,
even if I DO get a disk drive (I probably will, if I can), I'd still want
something for mass storage. All I really want to know for now, is "is it
possible?"

I'm sure it's possible. It has been accomplished on the PC. Hardware consists of a cable connecting the SIO port of the Atari to a RS232 port on the PC. But, you need to convert TTL voltages to RS232 and vice-versa. The cable has a box in the middle with chips to do this.

(The hardware would be usable on the Amiga, I think.)

Software is the difficult part. The source code is in 8086 assembly, and it's not available on the net.

You can find the executable and hardware designs on atari.archive.umich.edu....

All things are possible <grin>! Actually, there is a package avaiable
for MS-DOS already, and years ago there was one around for CPM as well.
Someone on the net is working on an Atari emulator for X Windows (as I
recall) and he is interested in working an interface in reverse (ie -- the
host end, not the disk end) as well as perhaps also as a drive.

There would be hardware envolved, the Atari SIO port is basically
TTL (open-collector outputs), and most serial IO is RS-232. Different
voltage levels, requiring IC buffers and voltage converters. Nothin
terriblly difficult, but not _just a cable_.

Perhaps someone can post references to the IBM-PC software/hardware,
I don't have it available. This might give you an idea of someone
else's approach.

Not if they are like our school district. They sure wouldn't spend $600
for an Apple II. Actually, they don't have that kind of budget, but there
are some pretty astute people there also.

TurboBase is the whole business package, while TurboFile, which _AC_ is using
for its database, is just the database of the TurboBase package. As I
understand it. (I own neither--just TurboWord+.)

>Amiga if I'd had the source, but I'll try :)

well, I may be able to help you out. A while back, I contacted the
author of AFS, which is an MSDOS program for the sio2pc. It does
basically the same thing as the software that comes with the sio2pc.
Anyway, I got the source from him, and have modified it a bit to
improve the timing & allow sio2pc image files to be used.

So I have C++ source (+ a little assembly) for the drive emulator.
There's still a few bugs, and I haven't had much time lately to
mess with it. I have the original author's permission to distribute
my version, and I'd be willing to help anyone out who'd like to
port it to another machine. In order to avoid a nightmare of
different versions floating around, I won't put the source on the
archive until its more stable. But feel free to email me if you
can't wait.

Hi, there! Well i got this problem, too. I sold al my XL hardware
some years ago and now I bought a really cheap 800XL without
cassette or diskdrive... *shame* Wouldn't it be possible to
use my Atari ST as a server? Actually I think that the programs
would load faster from the server than from my old 1050.
Is it possible to use the joystick ports of both computers to
do this? I am not so good with soldering and electronics...

3344. Atari 8-bit "stuff" 4 Sale

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-08 20:22:36 UTC
From: jws@cup.hp.com
Message-ID: <CD1xxo.G4p@cup.hp.com>
Source record: 105206

To those of you who think you have seen this before, you may have. This is the "whats left" list from one I posted a month or so ago...

I have the following Atari 8-bit stuff for sale. Prices are negotiable. I'll pay postage on the software (and on books explicitly included with software in the software list), but on the books and magazines you'll have to pay postage and I haven't included postage in their prices.

3347. What good games came out after '86? and a Action! question...

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-08 22:30:06 UTC
From: David Brady <Brady_David@Tandem.Com>
Message-ID: <CD23u7.D5x@tandem.com>
Source record: 105207

I pretty much stopped buying software for my 8-bit Atari around '86
or so. The Atari was used pretty extensively for word processing
until I graduated from college in '89, however.

I'm just wondering: did any really interesting must-have games come
out after that point? Care to list 5 or so?

Completely unrelated to the topic:
I created many programs with Action! but I always had problems accessing
the disk. The I/O libraries seemed to be a bit buggy and I could never
figure out what I was doing wrong. Are there any known problems with
the language? I'm thinking of resurrecting some of my projects...

3349. SyQuest Drives On the 8-Bit

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-08 22:55:52 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9309082159.AA18478@smithkline.com>
Source record: 105209

[For Richard Dell: I'm CC'ing this com to the newsgroup in case it may be of interest to anyone there.]

Hi Rich,

Thanks for caveats on using SyQuest drives as I described in my article in the August ATARI CLASSICS.

Several people- including Bob Puff- have warned me about using SyQuests. However, everyone who has cautioned me about SyQuests has based their warning on experience gained from using the older drives (5- or 10-meg) & carts. I have no experience whatever using those. And, apparently, folks who approach the SyQuests cautiously have little or no experience with the 44-meg SyQuests, which I gather includes you as well as Bob Puff.

My impressions are that indeed the older SyQuests were a tad touchy. I know for example you couldn't really do a whole lot of cartridge exchanging before you began to incur risk to the data and/or head crashes as you mentioned.

I'm here to tell yah the 44-meg units are VASTLY improved over the earlier models. You can swap them as often as you like, treat them like floppies etc. People who use them here at work- & who are constantly borrowing & swapping each others' carts, report no difficulties whatever. (And I can tell you, some of these people are real slobs, we're not talking about your fastidious types here!)

My own personal experience for the past 8 months of using SyQuests to maintain the precious data files of the AC subscriber list is that the performance is rock-solid. I'm now as confident with this media as I can be with *any* piece of computer hardware. (I always allow for some equivocation, since it is well known that all computer thingies do in fact harbor various devils & demons which are just waiting their chance to attack the innocent user.)

Such problems as I *have* experienced with the SyQuests were traced to things outside the system. For instance, I had a fancy gold-plated shielded expensive SCSI cable that WENT BAD ON ME (grrrrrr!!!), in fact this cable may have been responsible for the trashing of my Seagate drive. Also, I have a replacement IBM switching supply from Jameco that WILL NOT WORK with the SyQuest mechs but works fine with Seagates, go figure! The problem there I traced to the +12V bus which apparently wants to see an *inductive* load rather than a resistive one! Dumb! With resistive loads the voltage dropped to like 10V, & the SyQuest didn't like that. Even so, instead of crashing & wrecking my data cartridge, the SyQuest politely powered itself down & then flashed an error message with its little lites. This is a very civilized machine!

For good measure, I refuse to employ previously used cartridges as you warn about. Since they are only about $60 apiece, & the data they contain is

priceless, I feel it is worth the piece of mind to only use brand-new virgin cartridges. These I store in their special containers when not in use (although here at work people leave them lying on windowsills & every other gosh-darned thing). I do the low-level formatting, partitioning, & DOS formatting my own self. And I write out every detail of the partition map on the label of the cart, complete with start/stop sectors, sector counts, etc. I know the complete history of every cartridge I own & I treat them with lots of TLC. I'm probably pampering them too much as it is. I see these Philistines at work treating them terribly, & they still work fine.

Bottom line, I have yet to hear of any horror stories, or experince same myself, from the 44-meg SyQuests. At the risk of bringing on an attack of Murphy demons, I'll state for the record that this truly is a technology you can trust. And, apparently, you can even abuse it some, it will forgive you!

Having trouble getting through to Kamaro_Kid, so just need to post as
well as mail. Everyone else can just ignore this:

==========

mailed this darn thing everywhere, asked a few users, and have
heard nothing! Didn't know if you were still around the news-net.
You must've had a faulty router off your main net. Weird, NEVER
heard of any system losing so much mail. One for the record books.

You said:
>Most of that hardware is already gone. For detailed descriptions of each
>individual item, please refer to the Atari Classics Hardware Editor.

Ok, so what's left? I can remail all my old email to you, but you
probably have several copies sitting nearby :). I had about 6 specifics
on my list. You said the 1050, Syquest, 256k 800xl are gone. Ok,
everything else is still available? The question on the 1050 with
US Doubler, wellllll??? I'm not asking schematics here, just some idea
on what you're selling. ???

Also, where's this Atari Classics Hardware Editor? Is it posted to
the newsgroup? Is it a person? Too vague there... don't know what
you're talking about.

I AM interested in buying some of the list, otherwise I wouldn't have
mailed you 3 or 4 times and posted repeatedly to the net requesting
drives, etc. Once to you in the newsgroup too if I'm not mistaken.

Please respond within 2 weeks,
-Tim

PS: just in case you can't find my original mail to you, I'll
incorporate it below.

PPS: just in case your mail "DEMON" eats/loses the mail again, I'll
post to the newsgroup also.

timuszyn@jupiter.cse.utoledo.edu Mr. Fixit

Hmm, since I've been unable to reach this Kamaro_kid by email, thought
a quick post was in order. (Mentioned it in my last msg to all on the
disk drive topic.)

- - - - - - - - = = = = = = = = - - - - - - - - - - = = = = = = = = - - - - - - - - -

Saw this a while ago and emailed, but still have heard nothing, just
checking back:

} From: KAMARO_KID@delphi.com
} Date: 26 Aug 1993 18:56:52 -0500
} Sender: daemon@cs.utexas.edu
} Organization: UTexas Mail-to-News Gateway
}
} I have the following Atari hard/soft/firm ware items for sale or trade:
}
} Hardware
} ##
}
} Atari 1050 w/US Doubler chips $60.00

Just have to ask... this is drive/chips (already installed) one piece?
Comes with the software for the "ULTRA SPEED" or whatever they call it?
(So you can engage it while running DOS... I think it's a DOS patch or
autorun.) I think it's only one disk, right?

} Atari 1050 (stock) $30.00

How "used"? Around the block a few times? years? Still in new wrap?

} Atari XEP80 w/software & original packaging $50.00

Is this the 80-column hardware attachment for the older systems? Do you
need a monitor for this? Does it come with any type of word processing
software or ANYTHING that's designed to use the 80-column mode?

} 1 x SyQuest 5meg removable drive w/3 5meg carts $60.00

Need some serious help here... no idea on this one. Does this "hook
right up" somehow (with minor wiring)? Do you need a special DOS? Special
box? (Black box card, ICD... etc.)

} 1 x 1020 printer/plotter w/3 rolls paper $20.00

How many pen sets left with it? One set? Any extra black/color pens?

}
}
} Firmware
} ##
}
} AtariWriter w/manual $10.00

I would be VERY interested in this one if it's the original CARTRIDGE!
I get tired of loading this silly thing from disk all the time, the cart
would help quite a bit!

Thanks again,
-Tim

3351. Re: ICD, etc...

Source record: 105213

I for one would be quite interested. How much are we talking about investing? I'd love to buy a few "extras" of some of the old ICD products and see if I can improve on 'em. For the most part, they had some good ideas, but the implementations were a little off. They came out with the highly incompatible MIO box, didn't they? It only worked with a few DOS's and a couple applications, but I'd still love to get a hold of one!

-Tim

BTW: anyone feel up to burning MYDOS on an EPROM for me? It would make a great boot DOS!

nah, easy to work with on the Atari at least. A pain on most other systems!

: Same with variables.

nah again, Atari's strongest point besides graphics and sound capabilities!

: Everything anyone ever wanted in a program.

What is it? What is it?

Anyhow, I could get something about page 6 out of your msg. I for one wish most @$#%(^!*$#$! programs wouldn't use page 6! It's a real pain when you're looking for some quick swap space and EVERY "TSR-like" program out there seems to use it! I like to use it when I can, but have to have the system nearly bone dry of extra routines to play with it. Too bad the programmers never just used a small block after lomem... then reset it. I like using page 6 for EXPERIMENTING while creating a program, but avoid it in the final product! This way, if someone wants to load up some other user-hostile "neat" application that uses page 6 (@@#$*%*!@#$*), they can load all they want, but they have to blame all their lockups and incompatibilities on the other programs! My advice, avoid it! If anything, use the "cartridge space" semi-reserved in memory (that is, if your final product isn't running with basic or some other language). You've got a full 8 or 16K to play in there!

I wanted to get a null-modem hook up for my 8-bit and my Amiga. To make it easy to transfer files and stuff like that. Also to use the 8-bit as a terminal for my BBS for testing purposes. So I bought and over priced cable from Radio Shack which needed a gender changer to give it 9-pin Male for the P:R: Connection. It was just a serial cable so I had to buy a null-modem adapter, plus a gender changer because the Amiga serial port is male.. So after all this connecting I couldn't get the null modem adapter into the Amiga's port even though the genders were right.

My question: Can anyone give me part numbers etc to order a null-cable that would work? As I said I have a P:R: Connection and the Amiga's serial port is Male (DB-25).

The only probs ive had with A@TION! with disk I/O is finding somewhere to
put the damned data! :) (I still need to majorly play with ALLO@ATE.A@T)

As for good games

try mirax for@e (i get sik of it) '88
zybex (ive beaten it twi@e) '88
dra@onus (TOUGH and awesome) '88

all are very good games

i seem to have pirate versions! (I downloaded them from pla@es like
AtariBASE! yikes!)

Not sure exa@tly where you @an get them. Hopefully from no BBSes!

PS- anyone looking to sell a 256k or more 800xl for @heap?
I may (if im good and luky) be getting a BLA@KBOX!!! :)

Yes, I am also a naive idiot and I also run around pretending to know
something:

Newsgroups: comp.sys.atari.st,comp.sys.atari.8bit
""""""""""""""""""""

Xref: comp.sys.atari.st:64050
comp.sys.atari.8bit:12915
""""""""""""""""""""

...to wit, I pretend to know the difference between the ATARI ST
NewsGroup and the ATARI 8-BIT classics NewsGroup.

DM> Yes, he knows that a 68030 is better than a 68000....

...and both are better than a 6502, but what does this have to do
with the ATARI 8-BIT discussion?

DM> Everyone keeps telling him that....

...and I keep telling 68000 AMIGA and ST people from R.I.T. and
AT&T to stop crossposting in the COMP.SYS.ATARI.8BIT NewsGroup. It keeps
going... and going... and going... and going... ".EDU" sites, well sure...
but ".COM" sites ?!??

DM> But he doesn't say why it's better because he doesn't really know.
DM> True that in the rights hands, like Apple or Amiga, the 68030 can
DM> do some amazing things compared to the 68000. In the hands of Atari,
DM> the 68030 is just used as a fast 68000. So whether you have a 16 Mhz
DM> 68000 or a 16 Mhz 68030, it doesn't really make that much difference.

...and it doesn't make that much difference when someone is
moving up from a 6502, either. Both emulations would be an improvement, so
why is this debate important to a 6502 owner? I own neither an ST, nor a
TT, nor a Falcon. None of these machines are discussed in
COMP.SYS.ATARI.8BIT.

DM> You're confusing the issue of speed with the issue of processor.

...Uh, yes! I guess I am as well. I don't understand the
relevance that this discussion has with my processor, namely the 6502 ?

???
(If this discussion has anything to do with the 6502 8-bit ATARI
computer, then I apologize in advance.)

I think Trail Blazer came out after '86, which was a nifty little game.
Maybe I'm wrong on the year, but I remember it as one of the last big
Atari 8-bit games.

B&C ComputerVisions sells both Zybex and Dracunus, just look at the inside front cover of their catalog. See the Vendor/Developer list for contact information for B&C.

I just bought Zybex from them. It really is a great game!

I agree, TrailBlazer is another good one. Unlike most arcade style games,
I don't think I ever mastered it!

Another great game that was relatively recent is Infiltrator: a heliocopter
flight simulator, and two different scales of graphic adventures all in the
same game!

Plunging into the deep dank depths of my closet, I came up with some copies of a Astronomy/Farmer's Almanac program I wrote about 8 years ago.

It plots the postition of the sun and moon, the moon's phase, and graphically displays them on the screen. Subsequent screens tell you what is best to be doing in you garden on particular days.

If any of you are interested please mail me back. I would be happy to part with these real cheap. (Does $4.00 sound cheap enough?)

3363. 'Drol' little known facts

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-09 16:41:11 UTC
From: cb541@cleveland.Freenet.Edu
Message-ID: <26nmb7$j8n@usenet.INS.CWRU.Edu>
Source record: 105220

Somebody was talking about 'Drol' by Broderbund a little while back. I borrowed a copy and ran it on 800, 1200xl, 800xl, 800xl with osnxl and a 130xe. The colors are different on just about each machine, which represents differences in the OSes, I guess. The color of the turtle, which should be green was red on the 800 and 1200xl, blue on the 800xl and osnxl and green on the 130xe. The game must have been written on a 130xe.

I do believe I own one of the very first versions of Action!. Bought it at the OSS booth at a computer fair in San Francisco. (Back when you could get Atari stuff at a general interest computer fair...)

I'll try to pull out the code and see what exactly went wrong. I'll post a more detailed question when I get the time.

Thanks.

3366. Re: Gemulator 3.0!

Newsgroup: comp.sys.atari.8bit

>
> DM> You're confusing the issue of speed with the issue of processor.
>
> ...Uh, yes! I guess I am as well. I don't understand the
> relevance that this discussion has with my processor, namely the 6502 ?
> ???
> (If this discussion has anything to do with the 6502 8-bit ATARI
> computer, then I apologize in advance.)

But the whole reason that the 8bit newsgroup was added to the discussion
of the Gemulator was because version 3.0 was the first version that added
support for 8bit software. Be forewarned, though, that not all 8bit
software will work. I don't have the description of the GEMulator 3.0
but I think it does not support sprites, so most games are out. I hope
I'm not spreading false information.

So now, if you have a high end MS-DOS machine, you will be able to run some
Atari 8 and ST software as well as ms-dos software. Not a perfect solution
but better than trying to set up 3 computers in a couple square feet.

It has something to do with the video circuitry of the different
models. Drol was an Apple II port, which had a 280x192 pixel
screen... So they used the 320x192 Atari mode and made colors
by dithering.

I'd say the "turtle" was meant to be red. XL/XE models reversed
the "red" and "blue" dithering. That 130XE must have the tint
off a little.

Other Apple II ports which show the same effect: A.E., Hard Hat Mack,
Choplifter and more...

From: talmage@mentor.cc.purdue.edu
Message-ID: <CD3v57.J7w@mentor.cc.purdue.edu>
Source record: 105227

I was just thinking, has anyone ever tried to put, say, a 130xe into the case of an Apple IIe computer??? What i was thinking was, If i was able to do that then i could put a Multi I/O, a hard drive and a lot of the upgrades because there would be plenty of space.

what was ever found out about increasing the speed of the 8bits??? There was a long discussion about it over the summer but i was not able to read the end of it.

Just as a little project, wouldn't it be 'nice' (for a lack of a better word) to redesign the atari so that we could fit everything we wanted and also make it look good? You could always throw in a R-time 8 cart internally so that you don't have to worry about carts hang out. Add in the expansion memory, video upgrades, etc. There are so many things that could be done.

Has anyone tried to do anything of this sort?

Just a few thoughts...

Mike

Quite incorrecto'...

Old 800 game... pre-xl even! It's an oldie but a goodie!
You have to adjust your color and contrast to change the colors
correctly.

What's kind of neat is some Origin games (well, at least
Ultima IV) actually prompted you for the "correct color" 800/xl/xe
when you first booted the game!

-Tim

Jeff Lodoen states that my 130xe must be off and that the
turtle in 'Drol' is probably supposed to be red.
I don't think so Jeff. The colors just look all around better
on the 130xe. The bird's beak is orange. The girl's hair is
orange instead of blue or green.

3375. Re: sort of inventing a new 8-bit...

Mike suggests putting a 130xe, mio, r-time8 in a Apple IIe
case.
Somebody fairly famous with AC, one of the contributors, has his
8-bit in a metal IBM clone case, with a transkey IBM keyboard.
It must look like an IBM until he boots it up.

>8-bit in a metal IBM clone case, with a transkey IBM keyboard.
>It must look like an IBM until he boots it up.

I don't know about the *FAIRLY* famous bit, but that would be me. :-)

I've got an 800XL motherboard, 256k memory upgrade, TransKey, Black Box/Floppy Board, US+ replacement OS, and two 5.25" floppy drives (one 360k, one 1.2M) all stuffed inside an old IBM AT-style case. I've currently got a 101-key PC keyboard connected to the TransKey so, yes, you're right, it looks like an IBM until I boot it up. I've managed to bring the joystick ports, video and RF output, and the TransKey jack to the outside of the case so that I don't have to open the PC case to plug/unplug the joysticks or monitor. All this stuff (except for the BB, but this will change) is powered by the PC power supply. Over the next little while I hope to add a 3.5" floppy and a small hard drive to the system.

There are several things I just haven't had the time to do yet - in particular bring the cartridge port out. I'm planning on mounting both my R-Time 8 and SDX cart inside the case so that they're always accessible (again, without having to open and fiddle around inside the case) and stick a cart port on the exterior of the case to easily plug in things like my Basic-XE cart.

As Mike said in his original post, there's so many things you can do with a setup like this without having all sorts of carts (and a myriad of cables) hangin' out and spread all over the place. Those of you who are loyal Atari Classics readers have been following my exploits for almost a year now. Those of you who aren't really should be (not that I'm prejudiced or anything :-).

In the now-in-production October issue I outline how I almost blew up my setup.
Literally.

[...]
OK ATTENTION - MY POINT ARISES:

WHO OUT THERE USES LOTS OF PAGE-6
BASED ROUTINES (other than in
BASI@ or in their own programs).
AN EXAMPLE IS THAT HAPPY@UR.@OM
PROGRAM- it uses page 6 as a data
area. (My question should be more
"Who out there runs programs that
use page 6 a lot")

As I recall, K65 uses part of page 6 as a scratch area.

I've got a sick 810 disk drive. Symptoms:motor runs all the time with "busy" led on (even without a floppy in the drive) Yes,I've re-seated everything including all chips. I need:
1) some repair outfit around Colo. Springs or
2) a working drive at a reasonable price or
3) a schematic for the drive

Any help?

Ken

the transkey sounds neat, but isn't there any do-it-yourself
version of it, or something similar? I vaguely recall that
the transkey was originally done by some usergroup?

Well, Dra<onus is a game where you walk around in different s<reens (all 4 dire<tions), jump, du<k, and swat at enemies and breath fire on then: you're a dragon-man, that's why :) .. You get these different weapons (after hours and games of play, you'll HOPEfully find the best route and whi<h order to get them - without losing any extra lifes (sa<rafi<es, I suppose)).. you @an also turn into a newt (Monty Python anyone!?) and swim around to get to different parts of this big game. As I dont have instru<tions, I dont have the "story" behind it. It's not a s<roller, but has wonderful 16-@olor (yes!) low-res (not 80 x 192, but 160 x 96) graphix (they dont bother me! I happen to love these graphix!) along with Player Missle gfx for you.

As for Zybex, it's a 1 or 2-player side s<rolling a<tion shoot-em-up with WONDERful Animation (oops... dra<onus has really good animation too!), and is in a very similar graphix "mode" (only 4 @olors I guess... in Dra<onus the enemies and ba<kground sort of blend. In Zybex the enemies just get priority and get "drawn over"(?) the ba<kground)... anyways.. it has a LARGE assortment of enemies and enemy patterns and an array of fun-filled weapons to get and use. (My favorite is R-gun, of @ourse!)

Anyways... both of these games were written and produ<ed by the same folks and are available from Zeppelin games (!?!?!) in England (!!!??)

somebody remind me where to get these games so I @an buy them :)

If you wanted to mount an Atari-in-an-IBM-case, couldn't you adapt
the XEGS to an IBM case? It already has a separate keyboard and you
wouldn't have to worry about the keyboard differences. Of course,
I'm not a hardware-type so I really don't know if it would work.

You can save yourself a lot of money by doing the repairs
yourself.
Check with B&C Computervision and see if they still sell the
810 drive boards complete with chips. A couple years ago, my
drive went kaplooey, so I purchased a complete set of boards
for $40.00 dollars. It's simple to do.
I don't have their address handy right now, but I'm sure
someone here can fill you in on that and perhaps even tell me
if my suggestion no longer applies. (B&C may not have the stuff
anymore for all I know.)

I'm not sure, but I could probably write one! Want me to? I can do
BASIC or Action! :) As long as you provice an R: handler and know the
correct baud code (10 = 1200 baud, for example, on the 850/compatible
(most/all!?) R: Handlers).

It'd be groovy. :) (btw folks, I've started/killed MANY BBS projects)

3395. CC65

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-11 09:05:11 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <cFgP0B2w165w@cyberden.sf.ca.us>
Source record: 105055

Well, I finally got CC65 over from my friend's IBM (from Mac from FTP site wuarchive mirrored from atari.archive.umich.edu... <gasp> <whew!>)

Anyways... CC65.COM just jumps back to DOS when loaded under MyDOS. No errors are returned. The other files run fine. Ie, I go to [L]oad "LINK65.COM" and it says "LINK65>" as a prompt. (It's a Sparta'able program).

Then I tried it all under SpartaDOS. CC65 worked ok, but LINK65 (when I eventually got that far.. I'm trying to compile HELLO.C as the example in INTRO.DOC explained..) returned some error about "[garbage!] is not an object or library file" and returned to SpartaDOS.

I've got another complaint about SpartaDOS (I'm using disk-based, I set up a 192k D8: RAMdisk). EVEN THOUGH MY CURRENT (WORKING) DIRECTORY IS "D8:", WHENEVER I CALL "D:" IT LOOKS AT DRIVE 1!!! NOT DRIVE 8!!! WHY!?

A simple "DIR" command gives me a dir. of "D8:*.*"
A "DIR D1:*.*" gives me a "D1:*.*" directory, of course. BUT.....
A "DIR D:*.*" gives me a "D1:*.*" as WELL, no matter if I'm "IN" D1: or D8: or D8:GAMES> or wherEVER!!!!

Well.. anyways. I'm doing this, just as INTRO.DOC says:

CC65.COM
load under MyDOS - nothing happens

CC65 -V HELLO.C spartaDOS 3.2 here
RA65 HELLO.M65
LINK65 -O HELLO.COM RUNTIME.OBJ HELLO.C C.OLB
(adding D8:'s when I tried to
do it from RAMdisk)

Again, LINK65 says that some file (it displays garbage) is not a library or object file!!!

Other complaints:
1) Sparta thinks D: is D1: (I thought it was CC65's files)
Already noted :)

2) CC65 doesn't load under MyDOS !? Already noted too :)

3) LINK65 gives a fouled-up error Already NOTED!

4) CC65, when the file is not found, just says: "No errors" and dies. I have to [RESET] back to the SpartaDOS "D1:" prompt.

5) The other CC65 programs (LINK65, RA65) don't close some chan-
nel when they can't find the file or complete their duties,
and THEN, when I do something like "DIR" from SpartaDOS, I get
an Error - 129 (open channel!!!)
That's CC65's files' faults for not closing the channel before
exiting

AS WELL AS

SpartaDOS'S fault for not closing before doing ANYTHING!

I make it a point to always do this in any language (except BASIC,
because a "RUN" or "END" (or just end of program) ALWAYS closes all
channels (well, 1-5 I guess :))

```
Proc Dir(Char Array Mask)
Close(1) ; SEE!?
Open(1,Mask,6,0)
Do
InputSD(1,Mask)
PrintE(Mask)
Until EOF(1) Od
Close(1) ; SEE!?
Return
```

..

```
Proc Main()
Close(1)
..
..
Close(1)
Return
```

That's not TOO good of an example, but say some error gets trapped with
ERROR=procedurename and the channel never gets closed! (see the second
Close(1) with the "SEE!?" after it).

Also, I trust nothing to Close for me before I run, so I have that
Close(1) right at the beginning of the Main()..

But.. SpartaDOS is screwy (TOTALLY!) and I need a hard disk.
(WHERE'S THAT DUDE WITH THE $40 FOR 3 MFM-SCSI/SASI CONVERTERS!?)
(ANYONE SELLING A USED BLACKBOX? ANYONE SELLING A USED 800XL

From: phbill@cyberden.sf.ca.us
Message-ID: <PZgP0B3w165w@cyberden.sf.ca.us>
Source record: 105056

That guy selling the 3 MFM->SCSI etc converters for $40.. please
contact me!

Anyone selling a used Black Box interface please contact me!

Anyone selling a used 800xl with expanded (256k or more) RAM please
contact me!

I'm looking to converting from:
256k 1200xl w/ 800xl OS & no PBI
to 256k 800xl w/ 800xl OS & pbi
or 256k anything w/ 800xl OS & pbi, I guess! :)

Then I'd like to add a Black Box + MFM to SCSI + MFM drive.

(I've been offered a free 20meg MFM drive, so the MFM -> SCSI would come
in VERY handy, since Black Boxes do SCSI! My problem: no PBI or ECI
ports to connect the Black Box to, and no MFM -> SCSI adapter yet. The
price was $40 for all three, so $15-20 isn't bad for just one!!!)

I suppose you could, but, other than the separate keyboard, the XEGS is probably the least expandable Atari model. There's no PBI bus, all the chips are soldered, and it used those 64K*4 ram chips instead of 64K*1. I think Innovative Concepts made a ram expansion kit for the GS, but I hear they're out of business.

The current working directory and the default directory are two different
things. D: always calls the DEFAULT directory. This is NOT what your
Sparta prompt reads. The only DOS I know of (my memory may be faulty here)
that allows you to change the default drive is SpartaDos X. SDX works like
what you are expecting the disk-based Sparta to do. D: represents the
drive represented by your current prompt. For all other DOS's, D: is
always D1:

Atari coded some all-new games for the release of its XEGS in 1988. Airball, a hit on the ST, was one as well as a completely rewritten Mario Bros. I have this one; It's the best arcade conversion I've seen on the Atari 8-bit, and the best version of Mario Bros. I've seen on _any_ platform. It even has the intermediate screens which introduce the various enemies.

These are in cartridge form only, as far as I know. Is Atari still selling them?

P.S. Even though I work with Sun and SGI workstations for my college study, I'm writing an Atari 8-bit shareware program at home. It's good to see people still supporting the 8-bit by purchasing new software.

3403. Wanted: 8bit stuff

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-12 05:28:54 UTC
From: rcmerrit@apgea.army.mil
Message-ID: <1993Sep12.052854.20207@apgea.army.mil>
Source record: 105065

hello there gang..
I know that most (not all but most) of this stuff belongs of rec.videogames.
classics but alas, I don't have access to this group. If you wish, feel free
to post the message there for me with a message asking for email only.

ok first off..

I. I NEED!!!!!!!!!!!!
A TV adapter for the odessey 2. I bought an odessey 2 at yard sale but I
can't plug it into the TV because that part was lost. If you have one, or
know where I can get one, LET ME KNOW!!

II. I want..
I want to get games that I don't have. I perfer atari 8 bit and atari
7800 carts, but I will trade/buy Intellivision, atari 2600 and who knows,
maybe others, just try me. I am still looking for Emerson 2001, Bally's
Arcade and Ventrex systems.
For Atari 8 bit computer, I prefer adventure games.
For Atari 7800, I prefer the last releases, since those are the only ones
I don't have

III. I have to trade:
a. Atari 8 bit computer
1. Millipeade
2. (I don't have these, but I know of a store that has several copies
of these and might get them if you want them)
Gorf, F15 strike egale and some crystal game
b. Atari 7800
1. Xevious
2. Ace of Aces
3. Hat Trick
4. Super Skate boardin'
5. Joust
6. Galga
7. (at the same store as above and I might beable to get them)
Food fight, Karatica, Pole Postion 2
c. For the Intellivision
1. Astrosmash
2. NFL Football
3. Carnival
4. Autoracing
5. Donkey Kong
6. Poker and Blackjack
7. Basketball
8. Skiing

9. Burger time

Speaking of A<tion!, just tonight in the past... oh god, how many hours!?
:(made a simple (not finished, but almost!!!) "Answering Ma<hine BBS"

you @all, it lets you sele<t AS@II, AtAS@II or ANSI (last two for
highlighting), then enter your name (just whatever you want...for now),
then it gives you a menu with these @ommands:

email the sysop
upload a file (I need that Xmodem xfer A<tion!
download a file library file thingy from the ar<hives!)
post a publi< mesg.
read publi< mesgs.

Messages are stored as "D:POST.###" and "D:MAIL.###", and it has one
supporting file: "MESGSERV.DAT" whi<h holds the "high message" numbers
for those two sets of files. ie- 0 would mean no messages, et<.

Messages @ontain: name (author) / subje<t / reply-to (it THREADs, folks)
and # of lines (just for fun)

It pauses every 20 lines of a message read with a [@]ont. / [Q]uit
prompt, lets you Jump, thread, Xit thread, Quit, Reply while reading, and
reads either short or long (ie, read the post data only then have the
ability to read the text, or read it all without asking you first).

The Email will be handled by the sysop from the Waiting For @all s<reen,
and it has a nifty editor (with word wrap.. yes folks, I wrote this.. all
tonight! hahah!) .. editor @ommands in<lude0

save
abort
delete line(s)
edit line
bakup (edit last line.. you get it redisplayed with the @ursor at
the end.. like hitting Delete at the left of a line in a
word pro<essor or on T.A.G. bbses (only good thing ABOUT
T.A.G. bbses! heheh!)
list

it lets you rename the subje<t of a post or just hit [ret] to use the old one when replying (or "NONE" when posting)... umm..what else. I guess sysop's email will have to reply onto the publi< area? I dunno.. Email vs Post is annoying me.. I might just add a user list/password with the ability to make messages "private" (like Mi<hTron - there IS no Email)

It's very very very @ool.. It's not upgradable via support files. To make it better, you'll need to hak the A<tion! @ode (and it's ugly and un@ommented, but I @an @hange it if anyone REALLY @ares).

As for size, it gives you a 40 x 99 (app 4000 bytes) buffer for messages (aka 50 lines of 80@ol stuff but only 1/2 way a<ross the s<reen). It doesnt @ompile in A<tion! when 100% of the sour<e is in the editor, so I @ut out a bun<h of "perfe<ted" stuff and have it In<luded.

Why am I telling you all this @rap anyways?

well, it IS 3:35am and I AM tired! :)

Whoever it was who wanted this, you've almost got it! :) :) :)
l

Oh yeah.. as to A<tion! being ADA and @ mixed.. well, never seen ADA (that I know of), but it DOES seem WAY easier to use than @... at least 8bit @'s... very very ni<e... @artridge based makes it all the more fun/easy to use! :)

(tHANKS BOB WOOLLEY FOR GIVING ME MY @OPY!!!! :) :) :) 9

S@ot@hDUp is in the works, too... the MyDOS dUP repla<ement

beta releases will be out within a month.....

its gonna take forever for a good version to @ome out tho! :) :)

>

EWww! gross! And wrong.. MyDOS makes "D:" be anything from "D1:"
(default, and like how most other DOSes assume "D:" to be) to
"D9:GAMES:ADVEN:ZORK:"!!!!

All "D:" a<<esses will "point" to that dire<tory way in your RAM drive.

It @an alSO be as simple as "D2:" even, so you @an swap whi<h drive is
the "default" drive whenever you want...

Sheesh... yuk.. Sparta is ReALLY wors that I thot! >:^)

3406. Re: Voicemaster

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-12 14:34:40 UTC
From: lmurdock@austin.onu.edu
Message-ID: <1993Sep12.143440.82149@austin.onu.edu>
Source record: 105068

It appears that my first message was deleted so I will repeat it.

I was wondering, how many of you bought a Voicemaster from Covox, Inc.
I purchased one of these units for about $90 and wasn't very impressed
with it. I really do like the voice recognition ability of the unit
(although it is pretty limited), but voice and audio playback really sucks.
I just wondered what type of things other people did with theirs.
I have several BASIC routines that do neat things (all voice controlled ,of
course) and could possibly be persuaded to provide copies to interested parties

I have always believed that my unit was defective because of the poor sampling
and/or playback quality. I even experimented with feeding a compact disk
signal into the input, with disappointing results.

Any type of discussion here would be appreciated. Please let me know what
kind of results you had.

: --- Mike

I have thought about that exact same thing all summer. I also believe that it would be fairly inexpensive. Powering the CPU is simple. Powering the disk drives is another matter, however. Here is my idea. I want to make a portable 8-bit that will fit into a briefcase or similar. I believe that an inverter will be needed to power the disk drive since its current power supply is AC (somebody please correct me if I am wrong). The only reason that I can think of the Disk Drive using AC would be for timing purposes. I have never really studied a schematic or anything though.

A power inverter is becoming fairly common, and the plans could probably be easily obtained. Powering the CPU could be done with a high power 6-volt battery connected to a 7805 voltage regulator. I am pretty sure the DD requires 9V AC so a 12 volt battery would be recommended there. I think it would be a very interesting project and have even done some planning on the construction of a battery that will occupy the entire surface of the inside of a briefcase, yet still be light enough to carry.
Ideas abound in my head. I would really like to have an 8-bit that I could take with me (wouldn't it be great?).

BTW: The only problem I haven't conquered is connecting a LCD screen to it. Any ideas?

In a previous article, cho@uimrl7.mrl.uiuc.edu () says:

>Can someone tell me how to make the atari 800 printer work with the
>ibm-pc clone?

Since the 800 is one of the computer models, not one of the printer models,
you're not likely to get much help until you can tell us which Atari model
printer you have.

Cho wants to know how to hook his 800 printer up to ibm.
M. Current says the 800 is a computer.
I say it don't matter what Atari printer he has, it isn't gonna work
on the ibm.

3415. 800XL PROB

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-12 23:08:27 UTC
From: lmurdock@austin.onu.edu
Message-ID: <1993Sep12.230827.54638@austin.onu.edu>
Source record: 105076

I posted this question this summer, but for some reason my newsreader decided
to kill everything related to it before I got to it. So if you don't feel
like seeing it again, mark it as read and move on.
I bought a 256K 800XL this summer, but its memory is configured in
such a way that it isn't compatable with anything (including MyDOS). I
was wondering if some of you with upgraded XL's could tell me what the
upgrades physically look like. This upgrade replaces the 64x8 chips with
256x8 chips. In addition, there is another IC which appears to control
access. I will verify the part number and the rest of the configuration
and report it later. I am curious what the Newell upgrades look like.
Let me say some more things about the upgrade. It is not XE
compatable. In MyDOS, seleceting XE compatable causes the screen to go crazy
and a crash. It doesn't do that if I select Axlon compatable, but none
of the ordinary page sequences work. Bank-switching is obviously not
being done. The original owner wrote an assembly program which created
a single density ramdisk out of some of the memory. But I would much
rather have a 192K ramdisk than a 90K one. The only problem is that it
only works with Dos 2.5 (not MyDOS). Does anyone have any ideas about
this? It is possible that this is a homemade upgrade, because the
previous owner was one of the early Atari gurus. Is it possible to convert
this (simply) to an XE compatable? I really need this to work with MyDOS.
I may have to eventually buy a Newell if I can't convert it.
I would appreciate any and all help. I have been fiddling with this all
summer and still can't get it to behave like I want. Thanks in advance.

I also bought an 810 drive this summer, and was giving it some maintainence when I realized that most of the IC's in the 810 were the same as in a 1050. What are the hardware differences between an 810 and 1050 other than the mechanism? I have a busted 1050 that I really wanted to work, and I hoped that I could swap the necesary components out of the 810 into the 1050. Unfortunately, I think I blew out the track zero sensor the last time I worked on it (whoops...). Thanks.

Source record: 105078

Hello!

I just have a bunch of random questions....

Jeff, Have you gotten anywhere on the 16-bit slave processor??? It sounded really interesting. If you haven't how far did you get??

Has anyone tried adding a second GITA chip? I heard about this somewhere but i don't remember. If you do know what was the advantage of doing so.

I am going to put my 800xl inside a IBM case. The question is, what are some good upgrades that i could do while i am at it. I only know of two memory upgrades, Novell and Rambo XL, which would be better. Can you even get a Rambo XL upgrade anymore? are there any video upgrades? I know there are for ther 1200xl but i wasn't sure about the 800xl.

Mike Jewison, what kind of disk drives did you put into your IBM case?

Ben, how about posting the table of contents to the Atari Classics here? Just to give everyone an idea what is comming up? Just a thought.

Last question (I think) Where can you get the removable drives for the SyQuest HD? I found the HD for sale but they didn't have any carts. for it.

Thanks for any help that you guys can offer...

Mike

3418. Data acquisition from thermocouple

Would anyone care for a beta copy of Message Server, my super-simply BBS program written in Action!?

I'm only going to supply Action! source, as I can't test very easily. (Constantly have to compile off of floppy when testing it with the modem!)

So far it's, oh, uhh, approximately 17k as source. The source is ugly, so I may end up un-streamlining it (I stuck lines together here and there to give the compiler some breathing room.. rather than having tons of [SPACE]-indents all over...) as well as commenting it.

Don't expect something for at least another few days from the time of this post (Sunday), but it's working very nicely (with local-logon at least) and has a pretty good 4000byte buffered editor :)

Any takers? Only Action! programmers with plenty of RAM (RAMDISK!) or a Hard Drive should be interested at the moment.

Thanx!

I'm sure there's been plenty of Sparta vs MYDOS wars, but I haven't been in this group long enough to see any. My apologies if I rehash anything.

>EWww! gross! And wrong.. MyDOS makes "D:" be anything from "D1:"
>(default, and like how most other DOSes assume "D:" to be) to
>"D9:GAMES:ADVEN:ZORK:"!!!!
>
>All "D:" a<<esses will "point" to that dire<tory way in your RAM drive.

If SD is logged into D9:GAMES>ADVEN>ZORK, then all D9: accesses will point to that directory. All the drives from 1 through 9 can be logged into directories like this, all at the same time, and Sparta keeps working directories for all of them.

My programs prepend a Dn:, n being the default drive, anytime someone types a filespec with no ':'. Thus, with Sparta, I don't even have to type the 'D:' to get access to my current working path.

>Sheesh... yuk.. Sparta is ReALLY wors that I thot! >:^)

Well, there are so many things that make Sparta better than MyDOS IMO, I don't think that's a fair statement to make, or a good enough reason to say that.

Source record: 105085

I used to have this problem with my 130XE several years ago. As I recall it was a very common problem, and the solution is to replace a resistor somewhere in the computer. I have the details at home in a magazine, so I'll dig them out & let you know.

The problem was (as far as I can remember) that there was too much voltage or current getting to the keyboard membrane and it was oxidising (or something like that)

Cheers
Geoff

Lance says he doesn't know what 256k upgrade he has in his 800xl.
The Newell 256k upgrade has a 3"x1 1/4" pc board with 6 little
ics in a row and one ic on the side. It has a 16 wire ribbon that
plugs into u20 socket(buffer). It has a 14 wire ribbon that comes
off the side which is wired to various places, like pins on Antic
and PIA. The stock 8x64k drams are replaced with 8x256k drams.
Yep, I would guess you might wanna invest in the Newell or CSS
256k upgrade.

(Russ, talking to Russ, says people need a new keyboard for 130xe)
Try this. I just did and it worked. With the mother board on the
table, jumper a small wire from two contacts on the keyboard
connector. These two contacts are the START key and you will hear
the 'beep' of a cassette boot.
The contacts are # 4 counting from the right and #3 counting
from the left. The motherboard on table like normal, the power
plug far from you, the keyboard connector near you.
Becareful not to mash the contacts.

There is a file located at the atari.archive anonftp site which is what got me started on my current hacking project. This file was written by Michael St. Pierre, the guy who developed the TransKey, and it gives very basic instructions on installing a Classic motherboard in a PC case. I can never connect to atari.archive because access is severely limited during the day, but you can retreive the file from the wuarchive.wustl.edu mirror site in directory /mirrors/archive.umich.edu/atari/8bit. The file is called (I think) transkey.arc.

> The question is, what are some
>good upgrades that i could do while i am at it. I only know of two memory
>upgrades, Novell and Rambo XL, which would be better. Can you even get a
>Rambo XL upgrade anymore?

Rambos are extremely hard to come by these days. Another 256k upgrade for the 800XL is the Wizztronics, currently sold by Best electronics. I talked about this in great detail in a previous column in Atari Classics. I don't know what the current prices are, but I paid $11 for the board, $14 for the 8 memory chips, and another couple of dollars for several other (cheap) components - total cost for the upgrade to 256k was just slightly over $25, plus shipping. The Wizzy appears to be fully Rambo-compatible and from what I've seen it's the cheapest 256k upgrade available for the 800XL. If you do decide to go with this be warned - unless Best has upgraded their docs on the Wizzy, the installation instructions are a little muddled. Either check your back issues of AC or else ask me for more details.

>Mike Jewison, what kind of disk drives did you put into your IBM case?

Both the 360k and 1.2M floppies connected to my Black Box/Floppy Board combo are Toshiba and they work just fine. I very recently (like last week) picked up a 3.5" 1.44M floppy for my PC. Before I install it in the PC I want to check it with the BB/FB and see how well it works. If it does (and I have do doubt but that it will) I'll probably pick up a second one for the XL.

Message-ID: <19930913140508.2.JRD@CIROCCO.SCRC.Symbolics.COM>
Source record: 105091

Date: Sat, 11 Sep 1993 05:05 EDT
From: yeshua.marcam.com!news.kei.com!sol.ctr.columbia.edu!spool.mu.edu!nigel.msen.com!well
!moon!cyberden!phbill@uunet.uu.net

Well, I finally got CC65 over from my friend's IBM (from Mac from FTP
site wuarchive mirrored from atari.archive.umich.edu... <gasp> <whew!>)

Anyways... CC65.COM just jumps back to DOS when loaded under MyDOS. No
errors are returned. The other files run fine.

CC65 is truly gigantic. Probably what's happening is that it's
colliding with some memory limit in mydos, and losing immediately.

Ie, I go to [L]oad
"LINK65.COM" and it says "LINK65>" as a prompt. (It's a Sparta'able
program).

Also DOS2 etc. All the CC65 executables try to intuit what sort of OS
they're running under, and do the right thing about expecting command
line arguments. Given the wide variety of OS'es out there, and the
limited number of them that I had available to test with, it may not get
it right sometimes.

Then I tried it all under SpartaDOS. CC65 worked ok, but LINK65 (when I
eventually got that far.. I'm trying to compile HELLO.C as the example in
INTRO.DOC explained..) returned some error about "[garbage!] is not an
object or library file" and returned to SpartaDOS.

See below.
[...]
Well.. anyways. I'm doing this, just as INTRO.DOC says:

CC65.COM
load under MyDOS - nothing happens

CC65 -V HELLO.C spartaDOS 3.2 here
RA65 HELLO.M65
LINK65 -O HELLO.COM RUNTIME.OBJ HELLO.C C.OLB
(adding D8:'s when I tried to
do it from RAMdisk)

I didn't go back and extract the doc to make sure, but it's supposed to
say HELLO.OBJ in the above command, not HELLO.C. Think about it for a
minute. The point of a linker is to link *object* files together, not
source files. If you could link the source, you wouldn't have needed to
do the first two steps.

Again, LINK65 says that some file (it displays garbage) is not a library
or object file!!!

And it's quite correct. HELLO.C is not a library or an object file.

Source record: 105092

I resently started using my 800xl alot.
This is mainly due to 7 cities of gold. If anyone would like to see how
surperior the Atari was to the IBM XT, compare this game on both systems.
(thank you goes out to the person on the net that I bough this game from)

Anyways, the system itself is a bit unsightly. (according to my wife) I
was wondering if there was anything like a holding case for it, its power
supplies and diskdrives to make it easy to tuck away and to pull out without
taking the whole thing apart each evening.

Adaping it to a PC case seems interesting but I don't think I want to put
that much work or money into it. Any suggestions?

Also, what RPGs were made for the atari?

Probably not necessary, see disk drive reference below.

>easily obtained. Powering the CPU could be done with a high power 6-volt
>battery connected to a 7805 voltage regulator. I am pretty sure the DD

A 7805 regulator has a minimum drop across it of around 2 volts, and so would require an input voltage of more than 7 volts for 5 volts output. There is a low drop out voltage device, the LM2940CT-5.0 which would be suitable for a 6 volts battery, I believe the minimum drop across it is .7 volts.

>requires 9V AC so a 12 volt battery would be recommended there. I think

The 9 volts AC for the disk drive is just for simplicity. The disk drive requires +12 volts DC and +5 volts DC, and the rectifiers and such are internal to the drive case. The supply components could have been put in the transformer case, but weren't.

I have not opened a drive case as yet (dern curiosity, maybe I'll open one tonight and look inside) but if they uses a straightforward fullwave bridge rectifier, and then regulate the +12 and +5 from the same filter caps, the whole drive could be run from a 12 volt battery with replacement of the approriate regulator with a low drop out version (I think the LM2940-12). Somewhat greater efficiency could be drived if both a 6 volt battery and a 12 volt battery are being supplied by splitting the regulators

in the disk drive, providing low drop out regulators for both, and driving the diskm drive 5 volt regulator from the 6 volt battery.

> I'd like to use an 8-bit to record temperature data, say from 0 to
>300 deg C. First, what is required to interface a standard type K
>thermocouple?

Thermocouple interfacing can be very complex. The signal from a type K thermocouple is of the order of 40 micro volts per degree C, so a swing of about 12 millivolts over the temperature range. This would need to be amplified with careful attention paid to offset voltage adjustments and drifts with ambient temperatures. Also, the _cold junction_ temperature would have to be compensated for.

And all that will give you a voltage output of some kind. The Atari input (analog) is designed for a resistive tranducer such as a paddle pot, although I have to take a look at the hardware reference manual to see if the actual input is voltage or current based. If current based, as in the IBM PC's, a voltage to current conversion would be necessary as well.

And finally, the Atari operating system reads the values as 8 bit values, hence 256 steps possible. Over the 0-300 degree C span, that would be a maximum sensitivity of 1.25 degrees C per step, or or 2.25 degrees F per step.

Source record: 105094

I managed to do something similar, but not as elaborately. Basically,
I found one of the old hinged plastic computer cases and placed most
of my atari stuff inside it in such a way that only the cables were
hanging out. Actually, my 800xl keyboard simply hangs out of the
case, with a MIO in the case itself along with the power supplies and
other misc. atari stuff (this contraption is located elsewhere
presently).

There are ALOT of power cables hanging everywhere and the thing has
its own power controller. Looks ugly but is ALOT easier to move
around and setup, as well as being a little better ventilated than I
would imagine a closed case would be, unless you have a fan or
something.

On a related note, I was thinking that a REALLY cool method for
improving a atari 8bit system would be to buy one of those SCSI
floptical drive which hold 21megs or so. I would like to do so myself
eventually since I would imagine that ALL of my old 8bit stuff would
fit on 5 floptical disks or so...

I think the Atarilab temperature sensor covers at least 0-100 C. I would doubt that it is very accurate, though. If you want to try interfacing something else, you should look for some article that tells how to program the joystick ports to use analog mode, and shows the pinouts. I think they are 0-5 VDC, but it's been a long time since I looked.

>this one; It's the best arcade conversion I've seen on the Atari 8-bit, and
>the best version of Mario Bros. I've seen on _any_ platform. It even has the
>intermediate screens which introduce the various enemies.

Atari released the following cartridges in 1988 and 1989:

RX8099 Atari 1988 Ace of Aces (by Accolade)
RX8101 Atari Dark Chambers (2600 Adventure style game)
RX8102 Atari Crystal Castle
RX8103 Atari Mario Brothers ((c) 1983 Nintendo)
RX8104 Atari Crime Busters (Lightgun game)
RX8108 Atari Necromancer (by Synapse)
RX8109 Atari Airball (Marble Madness style game)
RX8111 Atari Tower Toppler
RX8113 Atari Thunder Fox
RX8114 Atari Into the Eagles Nest (by Pandora Software)
RX8118 Atari 1989? Xenophobe
RX8120 Atari Super Football
RX8124 Atari MidiMaze

I could have sworn I played Mario Bros. at a friend's house long before 1988 (like say 84 or 85). When you say "rewritten", did there exist a different Mario Bros. for the Atari before this one? I was not all that impressed with the version I played. It was OK gameplay wise, but the graphics were pretty much 4-color. I would not call it arcade quality at all.

Are you comparing the original EA IBM PC release of 'Seven Cities of Gold' or the new Commerative Edition which came out last month and has VGA graphics, etc.? If the Atari still beats the New version, [which I haven't seen] that would be impressive - tho with the game play on the Atari maybe not that hard to believe.

Yeah, I found the old version years back also... probably 1985/86 or so.
It was pretty bad. One of the few games for the old 6502 monster that did the
"Nintendo effect"... you know, once a few too many things appeared on the
screen, the e n t i r e g a m e s l o w e d
d o w n. CONSIDERABLY!
(Nintendo's famous for it... surprised so many people bought that piece of sh*t)

If they did redo it, I might just have to check into getting it... hmmm....

Well, just wanted to get some info on what B&C Computervisions carries... not much luck getting a hold of them. Thought they were out of business, then suddenly, wham! Someone picked up! I was hoping for some general info on what they carry... but the guy (stoned would be the proper word I think) droned "mail me $1.00 in stamps and I'll send you a catalog..." or something to that effect. O-K.

I don't think I'd trust this guy further than I could throw him (which actually would be quite far)... anyone know what all they DO carry? I really don't feel like waiting a couple weeks for them to get my mail and reply... then waiting a couple weeks for their mailing to reach me... I'd just like a quick summary of what they carry! Anything short and simple!?!

Comparatively, is American Techna-Vision any better? I have a catalog from them circa, oh, about May 1993. They seem a little steep on some stuff, CHEAP on others. Unless B&C is much better, I think I might take my chances with ATV.
(They don't carry any used/rebuilt drives and things tho!)

I'm still wondering what Seven Cities of Gold is... Is it that game where
you control a little stick-man in an isometric 3D world, with optional
two player mode? If not, what's THAT game? ;) I remember sitting playing
that on an old 64 (of all things) on a bw TV and loving it...

Oh yeah, new releases of old, great games are NEVER any good. I think
there's a law somewhere. Look at LSL 1, look at Elite (16-bit vs. original
BBC)...

My 130XE has been acting up lately with the fuction keys going out,
I found that it occured because the membrane had simply come loose in its
connection to the board. I pulled it out and set firmly into the connection
and all worked fine. Its happened a couple times since but the same cure has
worked each time.

It depends. There was one very early model Atari printer (815? 825?) that
was connected through the 850 interface. Some of the later X??- model
printer also had a Centronics parallel interface. If your printer just
has the Atari 13-pin interface, the only way to connect it to an IBM is
with an Atari computer and a null-modem cable.

...your article may have had more creedence had you actually bothered
to look where you were posting it before sending it off. What does
emulating a 68030 have to do with the 6502 ?

FM> Well, is it? We all know the Falcon has a '030 attached via a 16-bit
FM> bus to the memory. Unless we use a 3rd party board, we can't use
FM> FastRAM to get 32-bit access via the CPU.

The speed of the Falcon 16-bit bus is immaterial to the 6502 owner.
You ask if maybe it is just you. Well, is it? In COMP.SYS.ATARI.8BIT ?

FM> You're full of it if you think that we're all supposed to believe it
FM> is going to perform as well as a Falcon.

Well, if you can all believe that 16-bit and 32-bit machines are
actually, in reality, 8-bit machines, then anything is possible!

FM> My point, Darek, if you would pay attention, which apparently
FM> is not your strong suit as you think you know it all...

Darek is not the only poster around here who could use a course in how
to pay attention, but apparently it is not a strong suit.... A little
attention paid to NewsGroup headers would greatly be appreciated by one and
all, as well !

FM> I am not suggesting in any way, shape, or form that you need to make
FM> a 68030 emulator. What I am saying is that if a user wants raw speed,
FM> they would need a high-end PC (486/50 or better) to equal a lowly Mega
FM> STe or slightly better.

Why would I want to emulate a Jackintosh? As a 6502 user I have no
need for a GUI.

KS> If anyone is willing to offer a little assistance, I'd sure
KS> appreciate it!

With an 800 and a program recorder and BASIC (but no disk drive) in
your configuration, your best strategy would probably be to locate an ATARI
BASIC program called "AMODEM 7.2" whose source code is written in ATARI
BASIC with some string definitions of inline Assembler code converted into
high extended ASCII (i.e. greater than 127 DECIMAL) string routines. If
you can get a cassette of this program, or a hard copy printout of the
program, you can use it to "jumpstart" your downloading from your SUN to
your ATARI without requiring a disk drive. As the program is written
mostly in ATARI BASIC the only problem you would have would be with the
Assembly Language string loaded code segments. You could type in the BASIC
statements, provided that your program source code is in what is called
source --LISTED-- format, a program that usually ends with an ".LST" file
extension. The embedded string litterals would be a problem, but you could
get a HEX DUMP of the code segments off of the SUN. The string litteral
Assembly modules are very brief, as most of the code for "AMODEM 7.2" is
written in ATARI BASIC. You could rebuild the string litterals by hand, a
byte at a time. I'm afraid that you are in the traditional "CATCH-22"
situation, namely, "How do you download your first terminal program without
using a terminal program?"

AMODEM 7.2 will give you Ward Christensen XMODEM. You can then use it
to download BOBTERM 1.22, which contains XMODEM, XMODEM-1K, XMODEM-4K
(FMODEM), YMODEM BATCH and some CompuServe protocol as well as 40 column
VT-52 emulation.

Good Luck!

I have no experience with the Covox, but there is a common problem
with the use of this type of device. The device samples at some rate.
If the input has frequency components above half that rate, information
at those frequencies gets played back at different frequencies. The
result can be pretty garbled.

The Covox may have a lowpass filter (ie bandwidth limit) on its input,
but then again maybe not. I would suggest finding out its sample rate
and putting a lowpass filter on its input. A simple RC would work
if you aren't too fussy. Y'know maybe a preamp with the treble turned
all the way down might be good enough to just try & see if it helps.

3456. MyDOS on cartridge

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-14 09:57:51 UTC
From: slackey@acheron.bbn.com
Message-ID: <SLACKEY.93Sep14095751@acheron.bbn.com>
Source record: 105020

I noticed some mention of MyDOS on cartridge go by, and it reminded me of when I thought about it back when I hacked on MyDOS. I made a version of the DUP that a) ran from RAM under ROM and b) had a small command line interpreter. It had some problems, such as using page 6 and some folks didn't like it using the RAM under ROM.

Well anyway the current discussion go me thinking about putting MyDOS on a flash ROM in a cartridge that acts like a very fast disk. It would be write-once, so a user could add the utilities he uses, then thereafter get very fast access.

Does anyone know current pricing on flash ROMs? Or if 256Kx8 or 1Mx8 are available?

: summer and still can't get it to behave like I want. Thanks in advance.

: Lance "Ate_bit" Murdock
: l-murdock@onu.edu
: Senior Electrical Engineering Student
: Ohio Northern University

And here is the followup I mentioned. Examination of the upgrade really got
me nowhere. But here is the configuration. There are of course 8-256k
drams replacing the 8-64k originals. The resistor which connects these to
the power supply is cut, and the free terminal is then jumpered to power
another IC. This IC is a 74LS153. I don't have my Digi-Key Catalog, so I
don't know what it is. Three wires leave the chip and find their new
home in pins 14,15,16 of the PIA. There are also three wires that
end up at pins 8,9,10 (I think, if it is a 14 pin IC) of a 74LS158.
The 74LS153 is located directly next to the memeory DRAMS and is the top
one of the two. There are a few other miscellaneous connection that I
either haven't or can`t explain. Can anyone tell me what the 74LS153 is,
and what it might be doing? Oh, one thing I forgot to mention, The three
pins which go to the 74158 REPLACE these pins, not connect to them. The
original pins have been pulled out of the socket. The pins which go to

the PIA connect to them, not replace them.
I am going to make some guesses here, and hopefully someone can
enlighten me if I am wrong. I believe that the 74158 is some sort of
buffer. It would probably have to be this or some type of memory controller.
(I guess a buffer though) I really have no clue what a 74153 is, though.
I don't think that there is anything that I cannot correct (or repair) if I
need to change the upgrade to make it XE compatible. So I guess it is about
time to invest in a Newell board. I hope someone can decipher this upgrade.
This could be an impressive upgrade, but if it only works on DOS 2.5, what
good is that? Thanks for everyones help.

Well if you look at my orginal message I said compared to the version put
out for the IBM XT. I assume the new version will require a 386 or better.
But in either case, I heard the new verson was delayed permentantly, (sort
of like champions), so when did it come out? Are you sure your not thinking
of pirate's gold?

7 Cities of Gold is where you have to explore the new world, trade (or go to
war) for gold and food and try to stay in favor of the king.

Certainly possible. I do it using an ATR-8000 (you may not be able to find one of those any more, but it is a Z-80 box which interfaces the Atari serial port to standard serial, parallel, and floppies. I have two AT-style half-height DS/DD 360K drives on it and they work fine, using MyDOS. They can also be used with regular Atari DOS 2 in SS/SD mode, so you can use all your other disks. I think with newer versions of MyDOS you can also use 1.2M drives. There are other interface boxes available with similar functions. Watch the "for sale" postings.

>printer also had a Centronics parallel interface. If your printer just
>has the Atari 13-pin interface, the only way to connect it to an IBM is
>with an Atari computer and a null-modem cable.

Okay, let's get this right. From the FAQ List, here are all the Atari
printers meant for the 8-bits:

820 Printer (40 col.)
822 Thermal Printer (40 col.)
825 Printer (80 col.), req. 850
1020 Printer/Plotter (print/draw in 4 colors)
1025 Printer (7-pin dot matrix, 80 col.)
1027 Printer (80 col., letter quality)
1029 Printer (7- or 9-pin??? dot matrix)
XMM801 Printer (80 col.)
XDM121 Printer (80 col., letter quality)

You are correct that the 825 uses the Centronics parallel port of the 850.
Other than that, all of the printers here use the 8-bit's custom SIO port.

The "ST version" of the XMM801, the SMM804, does use a standard Centronics
parallel interface.

I'd be happy to be told otherwise, but I don't think the XMM801 or XDM121
have Centronics parallel ports.

Does that cover everything?

Go ahead and get their catalog, you can afford the dollar. I consider what B&C carries to be "anything and everything you can get in new shrink wrap anywhere, plus used hardware, parts, and a PD/shareware selection." The catalog is quite big. It's too bad they don't seem too interested in making phone sales, but I did place an order by mail recently and the delivery was timely enough.

> Comparatively, is American Techna-Vision any better? I have
>a catalog from them circa, oh, about May 1993. They seem a
>little steep on some stuff, CHEAP on others. Unless B&C is
>much better, I think I might take my chances with ATV.
>(They don't carry any used/rebuilt drives and things tho!)

My summary of American T-V would be something like "one truly classy mail-order dealer, with an 800 number, that sells nothing but new, commercial software and hardware (mostly parts)." Whenever I look to buy 8-bit stuff, I consider American T-V first.

Its real easy- just pick up a PERCOM disk drive for the atari.
Percom made the bright choice of just building an interface for the Atari
Serial I/O and a standard IBM dd. If you find one, you can use the
5 1/4 DS/DD drives for 367k, or go nuts and use some 3.5" for 720k.

Most Percoms will handle 4 slave drives per controller- but they came
with one big full size drive. Just toss it and slap in new drives.

Use My-Dos to get the DS/DD capacity.

Not only possible, but an available product! Check out the XF Single Drive Upgrade (with or without drive mech) from Computer Software Services. It lets you convert an XF551 to use a PC DSDD floppy (360K 5.25" or 720K 3.5"). It also fixes some bugs in the XF551 operating system. You can also read IBM DSDD disks with this setup (but not execute software for an IBM).

Don't have an XF551? Look into CSS's Black Box with Floppy Board. It lets you use up to 4 "standard" floppy disk drives (up to 1.44MB). Access to the drives is at parallel bus speeds (close to the speed of a hard drive). You can both read and write IBM and ST disks with this setup.

Give them a call at (716)429-5639 (they're in Rochester, NY).

I believe the Atari XF551 disk drive uses industry standard drive
mechanisms and is capable of 360K. I have a catalog from CSS and
they have upgrades for the XF551 that will allow a 720K 3.5" drive
to replace the standard one. They alwo have a Dual Drive conversion
that will allow both a 360K 5.25 floppy and a 720K 3.5 floppy.

3472. Classic Atari Cartridge List

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-14 18:45:59 UTC
From: ultron@csd4.csd.uwm.edu
Message-ID: <2753h7INNka4@uwm.edu>
Source record: 105030
Cross-posted to: comp.sys.atari.8bit,alt.games.video.classic

Here is a list of all the known cartridges for the Classic Atari family of computers, as maintained by Kevin Chase. Please help out in filling in the holes! There has been a lot of talk about cartridges of late, and lots of lists of cartridges for sale, so I know some of you out there could help! If you own any of these cartridges, or know of some others, please take the time to inspect them and send any new information to Kevin or myself.

Thanks!

Classic Atari Cartridges for the 400/800/XL/XE computer, v. 2.5

Some of the list has been distilled from old magazine ads and reviews, and may be subject to error. Entries with question marks after them may not exist in cartridge form, or worse, may not have been released at all.

I'd would like help completing this list. Comments, additions, and words of encouragement are all appreciated, and will be noted in the contribrutors list at the end of this post.

Kevin Chase <chase@physics.rutgers.edu>

In article <Sep13.201709.19734@acs.ucalgary.ca>, dbstrutt@acs.ucalgary.ca (David Bryan Strutt) writes:
|> Anyone ever tried interfacing a PC DD floppy with an Atari? Is it
|> even theoretically possible?

I know of a guy down in Virginia who bought up all the old Percom stuff when Percom abandoned us lo those many years ago. The last time I talked to him (which was probably over a year ago) he had a number of Percom AT(?) and RFD cards in various states of repair. I personally own a Percom RFD-44S1 (DS/DD) and I have added a basic 360kB drive mech to it. If you can pick up a Percom controller from him all you need is a drive, ribbon cable (between the board and the drive), an SIO cable, and some sort of power supply. He may even have some of these other items in stock, as well. Assuming, of course, he has any stock left at all.

If there's interest, I'll see if I can locate his name and phone number from where it's buried at home and post it here.

Why is this question being asked again? I just answered it a week ago. It
must still be on most systems althought I know some systems with space
problems expire articles pretty fast. I did restrict my answer to the
8bit newsgroup because that is where it was relevent.

AMEN!

P.S. GEMulator 3.0 was the first version that supported the Atari version
of the 6502. It allows you to run SOME of your 8bit software.

Just for completeness sake. I could not tell you what number they were cause
I no longer have them but the AtariLab cartridges were NOT in the CXL/RX
series of cartridges. They were compeletely separate.

Mario Bros. @ame out in 1983 or whenever, and again when the XEGS @ame
out... it was totally different. I have the 1988 version, and have seen
the 1983 version. The 88 does do the ar<ade justi<e! :)

3478. XEP80

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-14 21:46:14 UTC
From: tons@frosty.lerc.nasa.gov
Message-ID: <275e36$mkg@eagle.lerc.nasa.gov>
Source record: 105038

I'm looking for some info on the device that produces an 80 column display
for the 800XL. I think it was called an XEP80. I use my 800XL as a
terminal mostly and I would like to stop scrolling left and right. I
think my eyes are going to keep moving back and forth uncontrollably if
I don't get some relief.

I have a monitor capable of displaying 80 columns.

I would like to know if the device works well. Is it still available?
Where can I get one? How much are they? Any info would be appreciated.

Thanks.

3482. Happy drives

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-15 04:34:18 UTC
From: dragnet@crl.com
Message-ID: <27660a$afe@crl.crl.com>
Source record: 105043

Whatever happened to Happy Computer? Since I live so close to a lot of the 8-bit support places (and where Happy used to be), I should know, but alas, I don't.

I would like to get a Happy for my 1050, and I wonder if anyone still sells them, or if someone on the net would like to part with theirs.

I have my Happy apart, and if I can't buy one, I guess I'll just have to build another or something.

Too bad that the XF551 changed so much, or we could adapt the 1050 Happy to it.

What's a "Black Box" anyhow?

>I'm looking for some info on the device that produces an 80 column display
>for the 800XL. I think it was called an XEP80. I use my 800XL as a
>terminal mostly and I would like to stop scrolling left and right...

The XEP80 is still available. It works with BobTerm, although I've never really tried this. Hopefully someone out there can comment on this, but I'm guessing that it would work fine at 2400 baud, but have trouble keeping up at 9600.

The device connects to either one of the joystick ports, and each character is sent out in serial. It's much slower than the standard 40 column screen, but it can certainly be better than not having the ability at all.

I'm a bit dissappointed at how large a display the XEP80 puts out. It would be readable on my 1702 monitor, but extends past the edges of the screen -- much larger than the standard display area of the 8 bit. It presents no problems with the monochrome monitor I have, but I sure would have liked the convenience of being able to display it on the same monitor with the flip of a switch.

Personally, the XEP80 has been driving me crazy because of all the problems with the E: driver. It seems like every time I use it, I find another way that it is incompatable. Someday I may rewrite this driver, but it's not going to be anytime soon. Here's my list so far:

E: GETs do not truncate trailing spaces.
The beginning line pointer for E: GETs is not updated when changing lines.
The driver does not respond correctly to ESCFLG or DSPFLG.
Setting a TAB is updated from COLCRS, whereas the standard E: handler uses LOGCOL.

Probably more that I forgot about. It's just sad, because all of these are simple software problems that could be solved if the driver had been more carefully written.

Of course, none of this may effect what you want to do with it, if you are going to do mostly terminal stuff.

I have uploaded Vtex version 1.3 to the Atari archive at archive.umich.edu.
It is now available for download. If you don't know, Vtex is a Text file
viewer that I wrote for the Atari 8-bit. It allows you to page forward
and backward through a file, search for strings, mark blocks for saving
elsewhere, translate CR/LF combinations to Atari CR's, and much more.
Download it and let me know what you think.

3488. Re: XEP80

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-15 12:40:11 UTC
From: slackey@acheron.bbn.com
Message-ID: <SLACKEY.93Sep15124011@acheron.bbn.com>
Source record: 105051

I also had a problem with the XEP80 under MyDOS. I had to hack MyDOS to fix it. The problem is that whenever DUP reloads, it resets the E: driver to 40 column (ie restores the E: entry in HATABS back to its normal values). The comment on that piece of code was something to the effect, this fixes a problem of interaction between BASIC and some other thing. Anyway I commented it out, reassembled and it's fine.

BTW I have an editor I wrote for the XEP80 with a user interface modelled after emacs, because a) I was going nutty using emacs at work and something else at home, and b) this XEP80 showed up and I wanted to get the most out of it. I actually went to quite a bit of effort to make incremental screen updates to minimize the effect of the slow port to the computer.

>Ah, I didn't think it was that *heavy* on resources...

It doesn't matter.. i think its a federal law that all games must be 10+ megs
and require a minimum of a 386 dx 40...

Not to beat an old drum but why is everyone so happy to spend $2000+ dollars

to play a game such as wing commander which is pratically nothing more that
Star Radiers with fancier graphics. (ok, the story is an improvement)

3490. Re: What good games came out after '86? and a Action! question.

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-15 13:15:22 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <90626@cup.portal.com>
Source record: 104959

Do I understand the preceding portion of this thread to say that a Tower Toppler cart came out for the Atari XEGS? If so, I've GOT to have one! I further presume that it will run on the 800XL.

If I haven't TOTALLY MISUNDERSTOOD this thread, that is.

(BTW, on an unrelated subject, I appear to have missed an interesting pointer to a "MOD player" for the 8bit! Where/what is it???)

Chris

>out... it was totally different. I have the 1988 version, and have seen
>the 1983 version. The 88 does do the ar<ade justi<e! :)

Was the 1983 version also a cartridge, or was it a disk game?

Were any of the other cartridge versions of games released for the XEGS
different than their older disk counterparts (Rescue on Fractalus, Ball
Blazer, Blue Max, Lode Runner, David's Midnight Magic, Hardball, Flight
Simulator II, Archon, One-on-One Basketball, Karateka, Choplifter, Summer
Games, Ace of Aces, Necromancer)?

The Parker Bros. cartridges have a cart. design that doesn't
conform well to the newer XL cases/housings for the cart. slot. You need to
take off the rear screw of the cart. and insert it carefully into the slot
without the casing. (Be sure to de-stat yourself by touching something well
grounded) Also, you can try cleaning the contacts with an ordinary eraser
(An artists number 2 pencil is less abrasive though) And the last solution
(which I've tried) is brute force physicality with cart. by shoving it
in. (Just try getting it back out though)

ps. This problem is mainly caused by the larger triangulated sides which
keep the contacts from making a complete connection on boot-up of the
cart. (Replacing the casing with a standard atari housing from a junked
cart. would permamnently solve your problem though)

3495. Re: XEP80

Newsgroup: comp.sys.atari.8bit

In a previous article, jharris@cup.portal.com (John D Harris) says:

>The XEP80 is still available. It works with BobTerm, although I've never
>really tried this. Hopefully someone out there can comment on this, but
>I'm guessing that it would work fine at 2400 baud, but have trouble keeping
>up at 9600.

I've run BobTerm on the XEP80, it works pretty well. I only have a 1200
bps SX212, but the claim is that BobTerm on the XEP80 can keep up at 9600.

>The device connects to either one of the joystick ports, and each character
>is sent out in serial. It's much slower than the standard 40 column
>screen, but it can certainly be better than not having the ability at all.

I still can't figure out why people say it's slow. When you do stuff like
scroll through a text file, or even scroll down a file in AtariWriter 80 it
seems exceptionally fast to me.

>I'm a bit dissappointed at how large a display the XEP80 puts out. It
>would be readable on my 1702 monitor, but extends past the edges of the
>screen -- much larger than the standard display area of the 8 bit. It
>presents no problems with the monochrome monitor I have, but I sure would
>have liked the convenience of being able to display it on the same monitor
>with the flip of a switch.

That's exactly what I do, on my monochrome monitor. I do have to set the
size smaller to fit the XEP80 display on the screen, but it works.

>Personally, the XEP80 has been driving me crazy because of all the problems
>with the E: driver. It seems like every time I use it, I find another way
>that it is incompatable. Someday I may rewrite this driver, but it's not
>going to be anytime soon. Here's my list so far:

Here's hoping you give it a shot!

3497. News-Disk 13

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-15 17:52:14 UTC
From: djg0@aber.ac.uk
Message-ID: <9309151752.AA18749@deca>
Source record: 104958

I have been informed that the News-Disk issue 13 has been uploaded to the archive on my behalf (as they will all be from now on). It should now be in the Djg directory, and called issue13.arc.

The News-Disk is now published and owned by DGS, which is my new company. The News-Disks are actually copyrighted material, but because I'm such an incredibly nice guy (!), I have always made them available for free on the archive. However, as from issue 13 the News-Disks must start to show some sort of profit (even a very modest one!). Because of this, the News-Disks now come in two forms: a subscription version (for subscribers), and a download version (for people getting it from the archive and other sources). You will all get the download version from the archive. You are asked to make a small payment to DGS for the disk. This isn't a vast amount. All we need is US$3 for each person who gets a copy of the News-Disk issue 13 and onwards. Sort of a shareware magazine system!! Just send US$3 in cash to us at:

DGS (NEWS-DISK)
62 THOMSON AVE
BALBY
DONCASTER
DN4 0NU
ENGLAND

If you have never sent letters abroad, then don't panic - it is not as hard as most people seem to think!! It costs 50cents to mail the letter to the UK from the US. However, nobody will send the firing squad around to your house if you decide to cheat and just stick 2 29cent stamps on!!! You just have to write "AIR MAIL" somewhere on the envelope (along with our address of course!)

Of course, there is no way we can make you pay your $3, but it would help us keep the News-Disk running. At the moment, DGS is supporting the News-Disk, but I want to try and make the News-Disk self-accountable soon. PLEASE send your $3 contribution. Thanks!

Why not subscribe?? A 4 issue subscription costs just $20 by airmail. Disk subscribers get their issues up to a month earlier than downloaders, and are also eligable for any special offers we run. To subscribe just send your US$20 in cash to the DGS address shown above.

Any questions?? Send email to: djg0@aber.ac.uk

Dean Garraghty.
Editor, Atari 8-bit News-Disk.
Proprietor: DGS (Software).

Message-ID: <278mor$6o8@news.ysu.edu>
Source record: 104963

Oh yes, I'm using the xep80 w/a green screen Magnavox and the quality
is excellent. I once had a Magnivox Display 80 RGB monitor that
worked well with it but it blew the fly-back transformer ($165!)
so I bought a new LXI color monitor but the display is off the
screen too so thats why I still use the green screen.
I use AtariWtr.80, Bobterm 1.22 w/2400 b. modem, and a few other
programs I wrote in BasicXE daily. The BXE programs and Bobterm
are excellent with the xep80 but the aw80 is sometimes terrible
(as I explained in the previous msg.)

Source record: 104964

Lance,

It sounds like you have the ORIGINAL Claus Bucholz upgrade which appeared in Byte magazine, like 1985 or somewhere in there. I mentioned it in the first or 2nd installment of my series on Memory Upgrades in Atari Classics.

It predated the 130XE, and used banks of 32K instead of 16K, thus the incompatibility problems. Go to the atari archive, and get addmemb.arc. In there is a file describing how to do the new version of the Claus Bucholz upgrade, which is what the Rambo XL and Wizztronics upgrades are cloned after. You got most of the chips, only need like one more, if your Antic chip is a newer one. You check the part number,,, it's in the docs.

Got your soldering iron ready?

>
>Hello!
>
> I just have a bunch of random questions....
>
>Jeff, Have you gotten anywhere on the 16-bit slave processor??? It sounded
>really interesting. If you haven't how far did you get??

No, I'm busy tracking down bugs in Turbofile, to make Ben's life a
little easier. The latest hardware hack I've done is a 2nd PIA in my
1200XLD. CUrrently I got it as a fast printer interface, with P: handler
sitting In Page 6. I've got to add a SRAM that will be switched into the
OS ROM address space, so that you can write to the OS ROM, without
affecting the DRAM under the OS ROM, thus allowing you to still use the
RAM under ROM programs like SpartaDOS 3.2d and TURBOBASIC XL.
THis is a big fault I found with the Babylon upgrade.

I've also got revisions to make to Auxiliary Menu, it might outgrow Mac/65
and get turned into Action as I add more features. ANybody else using it
out there besides Joe? I'd like to hear from them for suggestions as to
what else could be put into it.

68881 math coprocessors are now about $70.00... which is starting to get
affordable. I've got the databooks. I don't think the electrical
connections are a big deal, it's the communications protocol between the
68881 and the CPU that are gonna be a pain to program/debug. Could really
make some graphing/spreadsheet/CAD programs ZOOOOOMMMM along though.

A high speed 65816 is limited by DRAM access. This stuff is still somewhat
mysterious to me. Jeff Potter has REALLY helped me along with donating his
older DRAM databooks to me. (I still owe him postage too!)
The first thing I need to do is get a Turbo816 running in an 8bit,
and I don't have a computer that it will fit in at the moment.
THe 800XL has Transkey and Newell 1088K, the 1200XL has a internal
XF551/720K floppy, and 256K, and US+/Omnimon OS and 2nd PIA, and soon
SRAM OS replacing US+/Omnimon, but also has additional logic/buffer chips on
it. Which reminds me, has any other electronics folk out there wondered how
all these people just THROW extra components on the BUS without buffering
DATA/Address lines? I mean, add the GUMBY upgrade, 2nd PIA upgrade,
stack Rtime8, Sparta-X, and an OSS cartridge, add 256K or 1088K or RAM,
and two or 3 OS ROMS in a Ramrod XL, and Man, your driving a LOT of stuff
off of the address/data lines.

The version of 83 was never released. It showed up on many pirate boards,
though. I have seen both versions, which are both good, but the later
version is more colorful. I think the gameplay is a little easier
in the earlier version, however.

As for the arcade version, I never played it. The best version I have played
IMHO is the mini-version stuck in Super Mario Bros 3. Though I generally
don't like most Nintendo stuff, there were some gems to be found in
all those cartridges.--

3507. Fundamental 800xl operation

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-16 13:08:40 UTC
From: cb541@cleveland.Freenet.Edu
Message-ID: <279ogo$r2k@usenet.INS.CWRU.Edu>
Source record: 104968

I have a 800 xl with Newell 256k upgrade that I plugged the
Antic chip in backwards and now it is busted. I know there are
some elec. engineer types here that understand the fundamental
electronic operation of the 800xl. Would one of them e-mail
me a description of the fundamental, basic operation of the
machine? Or is there a book about it? I have swapped out
every chip and some capacitors and resistors trying to trace
down the problem. I followed voltages and logic pulses all
over the mother board and compared them with a working 800xl.
I am about to recieve an oscilloscope and the first thing
I intend to do is check that clock pulses are correct.
There is something very basic to the operation of the
machine that is defective. It doesn't make it thru the
boot up sequence. Thanks.

1. The wing men (and women) are pretty much useless.
2. The sound track, while it changes, doesn't make me feel like I'm playing
a movie.
3. The asteriod field, yes those graphics were great. in fact, thats what
sold the game to me? But ya know what? Wing commander 2 came out and
replaced the nice asteriods with cartoon blobs.
4. The simulator doesn't feel any more real than star radiers. (not like
Falcon 3.0 which does FEEL more real)

3509. Atari 6502 Function Libs Available?

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-16 14:59:18 UTC
From: genghis@ilces.ag.uiuc.edu
Message-ID: <genghis.748191558@ilces>
Source record: 104970

I'm planning to start programming the 8-bit again after a hiatus of many years. The application I have in mind will be written in assembly language for speed and compactness (everything must fit into a ROM cart). I would appreciate any pointers to existing function libraries or other AL source code for the 8-bits which is PD and readily available for my personal use (this will not be a commercial product, but I may release it for other interested 8-bitters, if there are any ;-)

I know the definitive source will probably be atari.archive.umich.edu, but there's so much stuff there that is uncataloged I might miss something - hence this post. If you know of any AL source which might be useful to someone like myself, please drop me a note.

Thanks!

You hit the nail on the head. I used to get this problem all the time.
The quick solution is:

Take apart your computer, unplug the keyboard, take a pencil eraser and
gently rub the oxidation off the metal traces on the connector. They
should look silver instead of black.

That will put you back in action until they corrode again. When my
130XE was new, I had the problem a couple times, but since it isn't
powered up 24 hours a day anymore, I've not seen the symptoms in a few
years.

I'm interested in trading a TI 99/4a (the white one, has orginal roms)
for some atari 8bit hardware.
(I talked to one guy about it a few months, now that I have a spare ti, I'm
now more willing to trade it)

Its in prefect condition.

I've checked, and to me this does NOT sound like the Claus
Bucholz mod. It's close but not it.

3515. 130XE SYSTEM FOR SALE

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-16 19:43:00 UTC
From: james.alexander@canrem.com
Message-ID: <60.8589.4513.0N183DDB@canrem.com>
Source record: 104982

Ok, I'm selling a 130XE system. I don't really want to but I'm in need
of an ST hard drive and very short on cash.
This system contains the following:

HARDWARE:

130XE compter 600XL computer
1050 disk drive 810 disk drive
410 program recorder trackball & coleco joystick
2 Mpp modems (1 ea. 1000C/ 1000E)
2 PR connections, (1 works has cables manual/ other busted-no cables)

SOFTWARE:

F15 Strike eagle Silent Service
Letter/Spell wizard Family finance
Pac Man (cart) QIX (cart)
Eastern front (cart) Rescue on Fractalus (cart)
Ace of Aces (cart) Decision in the desert
Centipede (cart) Atlantis (cart)
Atariwriter (cart) Atarigraphics (cart) w/lightpen
Thunderfox (cart) Crossfire (cart)
Pilot language (cart) Deep blue C & mathlib
Interlisp v2.5 Word/spell/graphic magic
calc magic Memorease (educational memory aid)
Xtal Chop suey
Mydos 4.5 Atari dos 2.0s, 2.5, 3.0
Machdos Gauntlet & deeper dungeons
Ultima IV Wizards crown II: the eternal dagger
Raid over moscow Ogre
Beach heads I & II Wargames
Pole Position (cart) Final Legacy (cart)
Terry (eliza variant - apx) Robotron:2084 (cart)
Dig dug (cart) Stellar shuttle
Colossus chess Printshop
Newsroom Songwriter
Enhance pokey player Picture +/Lister +
Solar star Dropzone
Microsoft basic Tomahawk

NOTE: this covers most of my commercial software. I also have several
disks of pd/shareware and I HAVE ORIGINAL DISKS AND MANUALS FOR ALL
COMMERCIAL PROGRAMS. I also have a few cassettes as well (mostly
games).

I also have several books on the 8bit including the dos and computer manual, 3 or 4 hofacker books (how many of you remember those), and a few magazines (mostly antic/analog).

I'm selling the whole pile of stuff (no I won't break it up so don't ask) for BEST OFFER.

You can reply here if you're interested as I don't currently have an email setup (yet).

No, I think he means Wing Commander, with it's jerky graphics, slow play, total
lack of control feel and multi-meg space requirements.

But hey, with a 486-DX50 I've got FAST jerky graphics, total lack of control
feel, and multi-meg space requirements. I love my PC's too, but they just
do not have any playability in comparision with Atari 800's with their
good old four-switch joysticks (especially WICO Bat-Handles -anybody selling
any of those BTW?)... :)

When is somebody gonna wake up and ditch those shitty analog PC joysticks...?

AND TO ALL ELSE WHO DON'T KNOW.....

MOD PLAYER IS ON THE ATARI AR@HIVES (under Sound I think)
as

MODPL122.D@M - disk@ommed Atari DOS 2.5 disk with
Autorun.sys, dox, and a sample MOD

MODs are sound files with up to 32 different digitally sampled sounds and
the ability to play four of them at the same time.

This is tough using an 8bit with 1 digital voi<e! anyways, it has
been done and it works pretty good.

You @an only use MODs as big as 96k (it does NOT use/requires extra RAM)

I've gotten it to work on my 1200xl with 800xl OS, but NOT MY STO@K
1200XL!!!

I've @reated a MOD-less and DOS-less AR@ of the files and uploaded them
here and there on San Fran. area BBSes. It's only about 8k I think! The
D@M is about 60 or 70k I think, be<ause it's

a) not @ompressed
b) in@luding a big MOD as well as DOS 2.5!

So go get either one! THEN get a ton of MODs to go with your
GIFs
and WAVs
and whatever else 16:bit that
we @an play with now1 hhehhe

In Nineteen sixtey-five, yeah WOW!

Yes, thats what I really was getting at. In a round about way. The WC games I
could never get into the game. (I played all of them and enjoyed them)
However, with Star Radiers, I WAS the pilot. Sure the graphics aren't as
realistic, but I always though it was just a monitor because I doubt that real
space fighter would have huge viewing windows.
And I have a HUGE red wico joystick. the best dude!

>
>When is somebody gonna wake up and ditch those shitty analog PC joysticks...?

Well there is the Gravis game pad. But it isn't the atari joystick..

Thanx Bill! I missed that the first time it was posted, apparently, because I was away on vacation. Man, sometimes ya just can't take yer eyes off the screen or you'll MISS something COOL!

I'm gonna go get this shortly...

Incidentally, there's a MOD out there that plays a pretty decent rendition of the famous M.U.L.E. game title theme. Check "Aminet" sites for a file named "SampleNewStMULE.mod".

>Star Radiers with fancier graphics. (ok, the story is an improvement)

Star Raiders is very playable, but pretty simple. The big limitations are only 2 enemies at a time, simple enemy tactics, and only 1 hit to destroy them. There's not much dogfighting, and that's what makes Wing Commander fun to me. I could care less about the graphic improvements.

Wing Commander's big limitation, IMO, are limited missions that are always the same each time you play.

>When is somebody going to ditch those IBM analog joysticks.

When done properly, they way outperform the limited switch type sticks. I wish more Amiga programs would support analog, including Wing Commander.

Maybe WC on the IBM, which I haven't seen, didn't have a good implementation of the joystick interface. For some reason, a lot of programmers don't realize how important the interface is, and they don't spend much time on it.

>1. The wing men (and women) are pretty much useless.

I don't think I'd want them to be very good. I want to be able to shoot most of the enemies. In several missions it adds an extra challenge to have to protect the wingman (especially Maniac) from getting killed.

>2. The sound track, while it changes, doesn't make me feel like I'm playing
> a movie.

I want to feel like I'm playing a game, and I think the WC soundtrack adds nicely to the experience.

>3. The asteriod field, yes those graphics were great. in fact, thats what
> sold the game to me? But ya know what? Wing commander 2 came out and
> replaced the nice asteriods with cartoon blobs.

The asteroid fields may look nice, but they are the only part of the game I don't enjoy.

>4. The simulator doesn't feel any more real than star radiers. (not like
> Falcon 3.0 which does FEEL more real)

Star Raiders was a darn nice program. That's why it was/is so popular. WC is more complete though, and if it offered new and dynamically changing situations from game to game, I'd still be playing that one.

I wish I could get Falcon 3.0 for my Amiga.

The MOD player available for the 8-bit will play 4 channel MOD files of 96k or below at 5.6khz. You can find it on Archie easy enough; it's called MODPL122.DCM.

It's fairly clear -- for an 8-bit, and it has a few problems with 'specialty' MODs (i.e. ones that use the NT2.0 extended command set) but otherwise it's an impressive display -- again, for an 8-bit.

CYOTFS!

Agreed, the one hit thing is a tad limiting. However, Star Radier is an
8 k game, and I think it'll run on a 16k machine, WC is 3+ megs and
requires 2 megs to run with all the goodies,...

I wonder what a 48k star radiers would of been like.. hmmm`

No, I don't think so. I've got a 386-33 and it's fast and smooth and has very good control. Maybe you have a crap VGA card and a crap joystick and/or game card. And, gee, all those graphics and sounds take up space. Wow, what a concept.

3530. Print-Filer and Taskmaster

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-17 17:53:08 UTC
From: djg0@aber.ac.uk
Message-ID: <9309171752.AA12951@deca>
Source record: 104989

Well I said on the net a bit back that I had some new software available
from Rambit Software here in the UK. This is now available for you to purchase!
This post contains info on both Print-Filer and Taskmaster. Ordering info is
given at the very end.

We have made ordering easy again by accepting payment in cash in US$.

Buy with confidence. DGS is a long-established supplier of Atari software,
with 5 years experience. We are currently co-funded by the European Community
PrimeStart award, which is only awarded to companies who are carefully vetted.
Rambit Software has been supplying software for around 7 years, and is very
well established in the UK Atari market. Rambit and DGS -- the perfect software
partnership!

Dean Garraghty (DGS)
Dave Richardson (Rambit)

PRINT-FILER -- New from Rambit/DGS

You may already have heard of Print-Filer, which has been sold in the past
by Rambit software. However, DGS are now acting as distributor for Print-Filer.

Print-Filer is a very powerful printer utility, which opens new avenues in the
use of printed composition, offering an easy way of printing fancy letter
headings and other graphics in your text.

Print-Filer is loaded before you load the graphics software/ word processor
of your choice and will appear not to be there until you instruct your
software to print. At that point Print-Filer will spring into action and offer
you the choice of printing as usual, or re-routing the printer output to a
disk file. The disk file will then contain all the necessary commands output
by the print software to create the picture or the text document. The file will
simply contain everything intended to go to the printer. By having this file,
you can later print it without the need for the original print software being
present. But that's not all!

Print-Filer also comes with an editor, which will allow you to load in a
combination of outputs from any number of print software packages. These can
then be combined into one file which can simply be printed from DOS! Imagine
it, graphics and text together in one file which can simply be printed from
DOS!

Print-Filer is also a useful tool for word processor users who need to have
a fully formatted file which can be printed without the need for the original
word processor. This is perfect for creating document files for disks and
such like.

Print-Filer will only work with print software which uses a maximum of 48K. However, a special version has been included for Printshop users.

Print-Filer comes with a very extensive on-disk manual which explains in detail how to use Print-Filer, along with hints and tips on how to get the most out of the software. This manual comes in two formats: an Epson version which will only print on Epson compatible printers, and a standard text version for any printer.

You will need any XL/XE machine with 64K RAM or above, any disk drive, and any printer.

Print-Filer is available direct from DGS in the U.K. and costs just US$15 including Air Mail shipping. Ordering info is given at the end of this post.

Taskmaster -- New from Rambit/DGS

You may already have heard of Taskmaster, which has been sold in the past by Rambit software. However, DGS are now acting as distributor for Taskmaster.

Taskmaster allows you to save your cassette software on disk as files selectable from an auto-run directory.

Taskmaster includes commands for file handling, each with a help screen, and an integral monitor with direct assemble, dissassemble, edit, search, transfer and print options.

If your program loads into memory from cassette without error, then Taskmaster will save that program to disk, in total, completely, as if it had loaded straight from tape.

Some tape software contain non-standard "loaders", but Taskmaster is able to help find the "execute address" of the software. This will allow you to convert almost all tapes.

Taskmaster comes on a SS/SD disk, along with a printed manual. This manual explains in detail the tape conversion process of Taskmaster. The Taskmaster software will run on any XL/XE machine with 64K RAM or more.

Taskmaster is available direct from DGS in the U.K and costs just US$15 including Air Mail shipping.

Ordering Print-Filer and Taskmaster couldn't be easier! We accept payment in cash in US$. Simply send your name and address with your cash (don't forget to tell us what you are ordering!) to the DGS address given below. It costs just 50cents to send an Air Mail letter from the US to the UK. You are advised to insure your letter with the post office just in case the letter gets lost. This service costs $4.95 which includes the postage as well.

Our address is:

From: zeh1@ellis.uchicago.edu
Message-ID: <1993Sep17.183732.23207@midway.uchicago.edu>
Source record: 104991

Hi all. I just bought a 600XL that came with Star Raiders. I'm not really sure what to do, as it didn't come with instructions. Any pointers?

Also, are there any assemblers available for this machine? I'm thinking I could turn it into a microcontroller. (No, I wouldn't deface the machine to do this.)

Any help will be appreciated.

3532. HELP: Broken 800 Joystick Ports

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-17 18:47:37 UTC
From: totty@flute.cs.uiuc.edu
Message-ID: <CDIHJD.vv@cs.uiuc.edu>
Source record: 104988

I recently obtained an Atari 800, which seems to work fine apart from the joystick ports are hosed. I haven't investigated exactly what about them doesn't work, but programs don't work with them, and some interpret joysticks as paddles and the like.

I'll open this thing up to see if I can identify a problem, but I wanted to get some advice as to what might be a likely candidate for failure, to narrow my search. This could be as simple as a loose cable or unseated chip.

If it is component failure, any ideas what component might need replacing?

3533. ??? VT100 Emulator for Bit 3 ???

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-17 18:50:58 UTC
From: totty@flute.cs.uiuc.edu
Message-ID: <CDIHp0.19D@cs.uiuc.edu>
Source record: 104992

I recently obtained an Atari 800 with the Bit 3 80 column board. I'd really like to use this as an 80 column terminal, but I'm not sure what terminal software works with this 80 column board.

Does any kind soul know of a terminal emulator that works with this board? (If you have a copy, I'll gladly buy it from you!)

A VT100 emulator is most preferable, but I can probably survive with even a dumb terminal program!

>You might give us a clue as to what kind of application(s) you have in mind.
>Your original question is so broad it is hard to answer.

I purposely left out the details because what I'm looking for is as
generic as it gets, stuff that would be useful to just about ANY
program. For example, the type of stuff you find in the standard C function
library (e.g. printf(), fopen(), etc.) is very generic and no matter what
your application does chances are it can use at least some of the
functions in there. I'm simply looking to avoid reinvention of the wheel
on generic things like printing strings to the screen, getting input
from the keyboard, string manipulation routines, that sort of stuff.

I suppose I could clarify that this is not a game program, and involves
joystick input and output using standard OS text/graphics modes.

Sounds like some people miss the old Mig Alley Ace and/or Hellcat Ace of
the olden days. Mig Alley was pretty darn good for its time! Heck, two
players, split screen, taking on 1 to 4 (or was it 1 or 2) other "enemy
aircraft". Too bad they never did a "Mig Alley Ace II: via modem"...
not too much to update, would've been great! I've only seen one or two
COMMERCIAL programs out there for the old Atari's that used the modem
as a bridge for two-player mode.

3539. Re: HELP: Broken 800 Joystick Ports

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-17 20:20:01 UTC
From: popp@fledge.West.Sun.COM
Message-ID: <27d65h$754@newscast.West.Sun.COM>
Source record: 104999

The paddle signals feed into the POKEY chip (C012294, A101) and the joystick signals feed into the PIA chip (C014793, A102). The trigger lines go to the GTIA or CTIA chip (A301) on the CPU Board. There are a few noise filter capacitors and buffer resistors on these lines, but chances of the those going bad are pretty slim.

The most common cause of joystick problems are bent or broken pins in the connectors themselves. Check these first.

3540. Repost:atari questions...

Source record: 104864

I have three questions that I hope somebody can answer for me:

1) My M.U.L.E. game gets to the joystick screen, immediately flips to the choose-a-race screen and stops...And will not respond to anything. What is my problem?

2) What are the active FTP archive sites that I can access for Atari goodies and how do I reach them?

3) Anyone know of a Atari user group in the Cincinnati, OH region? i'd Like to contact them.

i'm just recently getting back into the Atari world, and need help! Feel free to E-mail me direct!

Thanks.

Actually, if you'll remember, Basestars could take a couple of hits and
any of the three types made you do some serious manuevers to land a hit
on Commander level... It could've been fancier, but for 8K ?(!!!!!!)

It's amazing what has been accomplished on the Atari's. In my opinion,
no machine will ever equal with memory, nice customs ASIC's and expensive
hardware what Atari did with a fiarly simple platform - style.

Power without the Price, as the saying went.

: No, I don't think so. I've got a 386-33 and it's fast and smooth and has very
: good control. Maybe you have a crap VGA card and a crap joystick and/or game
: card. And, gee, all those graphics and sounds take up space. Wow, what a
: concept.

Well, let's put it this way: The vast majority of my friends, as well as myself,have PC's ranging from 286-12's to 486-DX266's with Tseng-based, Trident, WD Paradise, ATI (including Ultra Pro LB's), Orchid, and myriad other video cards and a variety of game cards, not to mention darn-near every make and model of joystick known to the PC world. I've seen Wing Commander and Wing Commander II played on (very conservatively) 30+ PC's and played them on at least 12 myself (I don't like the game THAT much :) and have never witnessed decent playability on any of them, under straight DOS or OS/2 2.0...

I guess what really spoils it is the lack of tactility and smoothness of response. It's just never as clean. IMHO.

Star Raiders runs on an 8K machine.

>I wonder what a 48k star radiers would of been like.. hmmm`

Could be pretty darn nice.

On GEnie, some people were discussing a theoretical space game, which I'll summarize here.

A star field could be done with continuously redefined missles -- probably just one of them. Other PMG's would create enemy ships, shots, and a crosshair. Again, redefining could boost the numbers of these. Since nothing has been done with playfield yet, it would be neat to create a very large ship or space station that could be as big as you want. Done in cset graphics, it could be moved with screen scrolling since there isn't anything else in playfield, and most of the scaling could be made easier by having multiple csets.

The only nasty part of this theoretical design is trying to redefine graphics with the odd timing of character set screens. I've done it though, in the Bankster game that some of you have seen.

>Also, are there any assemblers available for this machine? I'm thinking I coul
d
>turn it into a microcontroller. (No, I wouldn't deface the machine to do this.
)

There are quite a few assemblers. The most popular is probably Mac/65, but
it has a terrible, almost non-existant editor. I'm not sure how it got
popular, since the editor gets a lot more use than the assembler does -- at
least for me. There's at least one assembler in the public domain or
shareware. I don't know its name, and you'll need to have a separate
editor program as I understand it.

If you can wait a little while longer, I'll soon be releasing a new
assembler system that has an integrated full screen editor.

Well, I still ask anyone to show me a better (in 3d aspekts) Atari 8bit
3d spa<e simulation. I borrowed my friend's SR-II and it is not at all
3d. The enemies barely rea<t to the ship's movements (the stars should
move less, right? They are farther away!) I was just playing SR-I a
little while ago and figured out the one thing I sort of disliked about
it.

Say there's an enemy in front of you (X=0), 100 spa<e unit's away (if
you're lined up, aka X=0 and Y=0), but Y=20 or something (so it's up a
bit). The spa<e unit's away that it DISPLAY'S is far less than 100.
I sort of figured one ex<use that almost holds true in some o@@asions,
and a bit more when it @omes to enemy display (noti<e how the enemies get
bigger and enemies/stars move faster the farther from the @enter of the
display they are? (looks @ool.. like a fish-eye lens))...

Well imagine it like this:

<+> <- Zylon

^ <- star @ruiser 7 (hehe)

----- <- "You"....

Even though "YOU" are SUPPOSEDLY inSIDE the Ship, things seem to move
around a little more as if you were behind it..

I dunno... maybe I was stoned when I was playing or something, but it
seemed to make more sense at the time than it does now...?! Oh well

ANyone wanna make SR-III !?!? hehehe

How about an SR where it's 3D like SR-I, has better gfx/display like SR-II, has some @ool planetary/galaxy-map like SR-II, and some simpler atta<k s<enes more like Zybex!?!? :) :)

Maybe it @ould be @alled SR-93 (or 94, depending on how fast a programmer you are hehe)

:) any game-makers up to it? '@ourse, I wouldn't want to see anyone RUIN the SR name by making a really stupid game

then again, atari did it... JUST KIDDING! SR-II has its qualities... :) ;) ;)

Uhm, then what precisely do I have, a cart that says, "Star Raiders II"?
Granted it has a case that you would find typical XEGS games housed in. I
remember seeing a Last Starfighter program somewhere, and when I
downloaded it, it looked like Star Raiders II except for some minor
changes. It "looked" cracked.

Beating the odds again: ATARI! 400/800/XL/ST/Falcon + Lynx Support

Well, the XL does have 4 joystick registers, STICKs 3 & 4 get the same values
as STICK 1 & 2. Those registers are also updated during the VBI. I guess
it's similar with shadow registers of the four paddle not used on XLs.

What's extremely slow on the old OS is characters printing on screen.
The E: and S: handlers don't seem to be a masterpiece of programing.

Hello,

My name is Edgar Beltran. I own an Atari 65XE computer but i haven't been very succesful finding information and documentation for it in Mexico. Recently a friend told me to post at your internet address in order to get some help. Could anybody there help me? I'm interested specially in electric diagrams and programmers references. Ah, by the way, How can i start receiving the digest?

My internet address is al531826@academ01.mty.itesm.mx

Thanks

3558. Just picked up a 800 XL

From: sml@kaiwan.com
Message-ID: <CDKAE5.13o@kaiwan.com>
Source record: 104863

Well, I picked up a 800 XL at a garage sale for $10. It includes the 800 XL, a 1050 (I guess a disk drive) and many cables. I have it set up on a TV, but I have a few questions.

1. No disks or manuals came were available. I've been reading through csa8bit for a while, and I noticed MyDOS. Is this publicly available, or how can I get my hands on it??

2. I also picked up an Atari XM301. Now I think this is a modem, since it has a phone jack in it. How does this connect to the 800 XL? Is it through the disk drive that it connects?

Sorry if these are faqs, but I could not find a FAQ for this newsgroup.

> Hi all. I just bought a 600XL that came with Star Raiders. I'm not really sur
> what to do, as it didn't come with instructions. Any pointers?
>

Well... here's the commands:

Title screen:
Start - start game
Select - select difficulty (novice, etc. .. 4 levels. Novice
being the EASY easiest.)
Reset - reset... Good for if you're mean and take carts. out
while the power's on, like I do. (Hey! I don't wanna
lose my RAM-disk!)

During game:
Start - Return to title.
Select - Same as Start.
F - forward view
A - aft view
L - long range (above) view. Can't kill the enemies here,
at least it's not at all EASY! (I never have).
G - galactic map. From here, use the stick to position the
second cursor (the first stays in the square you
currently are in) to the square you WANT to go to. You
will then be sent there when you go into Hyper space.
H - Hyperspace. See above. Also, ALWAYS do it from Front
view (select Front or Aft, and if Tracking's on, it will
automatically "track" the little pointer.) You MUST
keep the pointer as close to the center (crosshairs) as
you can to be sent to the proper place on the map! In
Novice mode, you don't have to worry. I always select
the fastest speed before a Hyper space jump so that the
pointer is moving around as little as possible (you have
to get up to Hyper space speed before you go into hyper
space!)
0 - Full stop. Slows speed down to true 0. Also aborts H.
1-9 - Different speeds. One being slowest. 9 is NOT the speed
just before hyper space speed, but is very close. See
above :).
C - Computers on/off. When computers are on you get cross-
hairs and a window on the lower right which shows the
position of an enemy relative to your display.
M - Change the currently-tracked enemy. This lets you chose

an enemy to be "tracked" by sensors. Info. is given at
the bottom for it's "azimuth" and "altitude" and distance
("R"), and it is the enemy being shown in the window.
T - Computer-tracking on/off. This automatically changes
your view to the currently-tracked enemy. (Note: Computer
usually picks the closest enemy. Or maybe it's just
Tracking-computer? Experiment. Try hitting [M] and see
if the T-C disagrees with you! :)) Your view will
flip from Front to Aft depending on the position of the
enemy. It gets annoying sometimes. In Aft view you
don't have the little window, and also the controls are
backwards (of course!)
P - Pause the game.
|/| - Inverse button (or Atari Fuji logo on the 400/800s).
Abort game. (It gives score and stuff).

Galactic Map:
Things listed:
=> <- a ship-shape. 1 or 2 enemies in sector
=- <- three dashes. 3 enemies in sector
== <- four dashes. 4 enemies in sector
* <- "Star" or "Asterisk". Star base in sector.
Damage control:
At the bottom, it says: "DC:PESCLR". DC means damage
control.

P means photons
E engines
S shields
C computer
L long range
R radio (updates map)

Blue means ok. Yellow means damaged. Red = destroyed.

Ever ".00" and ".50" on the "Star Date:" clock, the enemies move.

If a starbase is surrounded, you are informed and have very little time
to go save it by destroying some of the enemies around it. If you take
too long, you die.

To get to a starbase, simply go to the G-map, point to a starbase, go to
F-forward view (it might jump to Aft if you're in Tracking mode.. It's
ok), and H-hyper-space. It will be tracked, just "home-in on it". It's
a blinking yellow thing. Don't shoot. You CAN kill it! :) Get as close
as possible (front view) and it will say "ORBIT ESTABLISHED"/"DOCKING".
A little blinking silver guy will fly up to you (dont move) and fix you /
replenish your energy.

On the game screen, the following data is displayed:

E:9999 energy. 9999 is maximum. 0000 is death!
V:00 velocity. "43" is [9]-speed, the fastest.

K:00 kills!
T:01 tracking. The "T" will be a "C" if the [T]-tracking comp. is on.
o:+00 Vertical position.
0:+00 Horizontal position.
R:+100 Distance. (App 150 if "o" and "0" are "00" is about as far as
it can be to be barely visible.)

Little window: The Computer's window looks like this:

```
+---+---+
| | |
| +---+ |
|-| |-|
| +---+ |
| | |
+-------+
```

The box in the middle is where the enemy will be if it's "on the screen".

If it looks like this:

```
+---+---+
| | |
+-+---+-| <-dashes appear
|-| |-|
| +---+ |
| | |
+---+---+
```

Then you're horizontally "locked."

If more dashes appear on the OPPOSITE side (below), then you're
VERTICALLY "locked."

And finally, if it looks like this (aka you're RANGE (distance) "locked"
as WELL):

```
+---+---+
| | |
+-+---+-|
|-| |-|
|-+---+-|
| ||| | <- last set of dashes
+-------+
```

then shooting at the enemy will fire TWO SHOTS AT ONCE, BOTH LOCKED ONTO
(and will try their best to hit) THE TARGET! :)

I think that's all ANYONE needs to know about Star Raiders! :)

From: anyone@cyberden.sf.ca.us
Message-ID: <47930B2w165w@cyberden.sf.ca.us>
Source record: 104869

What is it about .ARC files that's so complicated that a poor program like SuperARC 2.4 has to make a TEMPORARY FILE when adding to the ARC..!?!?

Wouldn't it be just as simple to either open the file for Read/Write and then pretend to "View ARC contents" until it got to the end, then start writing the new ARC files?

Or isn't it even simple enough to just open the file fror Write+Append !?!?!?!?!?!?!?!

Just curious... :(

There is one simple problem with your approach using Read/Write Mode
and that has to do with SpartaDos. When you open a file in Access mode
of Read/Write and try to read to the end of the file you encounter a
rather annoying `feature` of SpartaDos. This mis-`feature` is that you
actually never encounter the end of the program. What really happens
is when you reach the end of the file and then read 1 more byte than
the file actually has, SpartaDos extends the file. In short terms,
when you try to read in an entire file using block reads and ERROR 136
END_OF_FILE to signal that you've read the entire file, it NEVER
happens! You merely keep on extending the file, until you encounter
ERROR 162 DISK_FULL. This would surely corrupt the .arc file and
the entire disk.
There are several programming tricks one can use to get around this.
In my Ascii->Atascii converter, I use block_reads of nearly 30k via a
stream (file iocb) opened in READ mode. I then do the character
conversion in place in the buffer, then write the buffer out to the
same file but using a Different stream which I have opened in
READ/WRITE mode to the same file. IE: If you have an entirely filled
disk of ascii files you wish to convert no problem, Since the files
remain the same size and no temporary file is needed. Also no
additional file deletion and renameing is needed. Using my 589 byte
conversion program which runs from SDX-Command line, it takes nearly
45 seconds to convert a 60k file on an XF551.
I could also reconfigure it to run via the 'X' command to get an
additional 8k of buffer space, maybe more. Perhaps even use Bank
Switching on Extended Machines. But 45 seconds on a 60k file is good
enough for me.

BRiTiSH

BTW: Once I finish my 80 column C source code file viewer I'll upload
these utilities to the archive.

3565. Re: What about ARC?

Another possible reason for temporary files: I don't remember if the Atari arc programs do this, but the files in an .ARC are usually sorted by filename.

The program was designed in 1984 and was going to be called
The Last Starfighter. Then the Tramiels came along and it was
put on hold until 1985. By that time the name didn't mean
anything (hey, it wasn't Star Wars) and they named it Star
Raiders II.

> a phone jack in it. How does this connect to the 800 XL? Is it through the
> disk drive that it connects?
>

Yes, the 1050 is a drive and the 301 is a modem. :) I've never seen that
type of modem, but I'm positive it must use the standard Atari SIO @able
(the bla<k 13-pin female/female type of @able), and yes, you should
"daisy-@hain" it off of your drive. Plug the 800XL into the disk drive
with one @able, and plug the modem into the the drive with another.

As for MyDOS, it is publi< domain, and the newest version is 4.53. It
@omes in two "subversions." One is a more old Atari-DOS @ompatible
version that lists sizes of files in 3-digit "SE@TOR" @ounts (app.128
byte blo<ks), the other lists in 4-digit @ounts, whi<h @an s<rew up some
old and less-de<ently made programs, but is good for using hard drives
and stuff... when you end up having HUGE files... greater than about 126k
(999 se<tors).

Sin<e you don't seem to have a DOS yet, it'd be best to find somebody
willing to mail you a disk with MyDOS. If you really want, I @ould send
you the 4-digit one (the one I use the most), along with a bun<h of other
good programs like TurboBASI@ XL, the SuperAR@/UnAR@ 2.4
@ompressor/un@ompresser pair of programs, Disk@ommuni<ator, the
disk-image transferer, and, oh, a disk full of stuff that I @ommonly use.

Don't trust me for speed though, unless you pay the shipping. :)

I have an Atari XE game system for sale. It comes with 6 xe games, 5 are new in the box. The only one that isn't is Bug Hunt. This does not have the keyboard. Includes the "box", power supply, switch box, one xe controller, and one Atari controller. (The only difference is the color of the joystick).

Includes these games

Bug Hunt
Barnyard blaster
Hardball
david's midnight magic
fight night
one on one

Buyer will pay $2.90 for shipping. I will pay the rest. I will sell it for the best price over $30, or trade it for other classic game stuff or gameboy or Sega Master items.

>on Commander level... It could've been fancier, but for 8K ?(!!!!!!)

Even those serious manuevers, and even though it was challenging and a lot of fun, didn't really feel like dogfighting. I really like the ship to ship fighting in Wing Commander. The dogfighting, weapons, shields, damage, and music all add to the experiance.

I've never actually seen any IBM versions of Wing Commander. I've only played it on the Amiga, with switch-type joysticks. I had always felt though, that analog sticks would have improved the control, just for having finer adjustments when targeting. It would be a shame if the controls in the IBM version weren't any good.

I don't want anyone to mistake my comments as being degrading towards Star Raiders. It's an amazing achievement for 8K, and for being released in 1980. I've played it more than any other space game, maybe even more than any other game period. It lasted an incredibly long time as the undisputed best space game. Certainly longer than any other program is likely to ever do.

In comparing to Wing Commander, (in hind-sight), it would have been better worded to say improvements in WC, as opposed to limitations of Star Raiders. I'm pretty sure I already said I didn't like the game in WC as well as SR, and didn't play WC anywhere near as much. I just liked the improved combat.

>It's amazing what has been accomplished on the Atari's. In my opinion,
>no machine will ever equal with memory, nice customs ASIC's and expensive
>hardware what Atari did with a fiarly simple platform - style.

The Atari holds two honors. It is definately the best 8 bit system anybody has ever, or will ever make. I think that's safe, since no one's likely to make another one. I also think it is the most 'ahead of its time' that has ever been done. Even more than the Amiga.

I will always love my Atari, and it's why I'm going to so much trouble to still be able to develop with it.

Yep I'm confused.

The quote came from one of the physicists that worked with the Mars Observer craft. I met him at the World Sci-Fi convention in San Francisco.

>The E: and S: handlers don't seem to be a masterpiece of programing.

Yeah, the OS spends a bunch of overhead with its device independance, and screen mode independant routines. It offers some great flexibility, but is not very fast. There are PD hacks available that more than double the display speed, at a memory cost of only 100 bytes or so.

I WANT IT! I've been wanting to write something like that, since I
was tired of only having 40 column editors. Unfortunately, between
XEP80 handler problems and lack of time, I haven't even started. I
may even be replacing my trusty 1200XL with a 486 within the next year
(talk about mixed feelings!), so it probably wouldn't be worth my
while to write it anyway.
How can I get your program???

I THINK I see the source of confusion. 99% of all people who have seen
wing commander have only seen in for the PC. (I haven't even seen the
box for the amiga version and we have a store that sells the stuff!)
But, most of the dog fighting is limited to a slanted hexagon plane,
the ships are all spheres (noticed that you can score a hit NEAR the
ship but only appear to hit space) Plus the graphics of the ships rotate
in quick jerky angles. Maybe the amiga version has cleared these
problems but these small anoyances make me like Star raiders more

This is a software only package. I am still refining the generl
software subroutines. I am using a custom display list which should
make scrolling a hell of a lot faster than Omnicom_80. As of now, I
am using a general text_font of 3*6 much like that in Omnicom, but
will probably fix it up. After I get a few hours of spare time, the
file viewer should be finished, and then I'll move onto my Emacs-style
text editor. I had wanted to finish this during the summer, but
unexpected events came up. (machine down time) And now during the
semester, I have a few software engineering projects to finish first.
I am not the one working on flicker-term. Omni is barable enough for
now. But I do want to see MegaTerm. Which reminds me, I have to find
my x/y/crc-modem routines to send to Itay Chamiel.

On occasion, I have heard 8-bitters speak of interfacing a T-80 micro-
controller to their Atari. I recently ran across an add selling these,
and was curious about what type of things can be done with this controller.
I think the price was around $70-$80 and was wondering if it would make
a wise investment. Thanks in advance.

Montezuma's Revenge is a maze/puzzle game -- walk through rooms, avoid obstacles/dangers, collect keys, open doors, etc. etc... You have to do the rooms in the right order, so that you have the right keys when you need them. Mexican motif, hence the title! I particularly like the graphics effect when you die and get your next life: your little man walks from a row of "spare" little men, to an arbitrary position, on a blank black screen, then the room graphics fill in around him, showing that his "arbitrary position" is really the appropriate on-screen position of where you died and are picking up again. Cool...

Killer Sattelites Starpath NEW 7
Kung Fu Master Activision NEW 3
Miner 2049er Tigervision New $8
Mogul Maniac Amiga rt only 5
Montezuma's Revenge Parker Bros cart only 10
No Escape Imagic cart only 5
Off your rocker ? no label 10
Philly Flasher/Cathouse Blues Playaround NEW 10
Private Eye Activision NEW 5
Racquetball Apollo cart only 5
River Raid II Activision cart only 10
Skateboardin Absolute NEW 5
Spiderdroid Froggo NEW 4
Spy Hunter Sega cart only 10
Supercharger w/Phasor Patrol Starpath Orig box&docs $7
Texas Chainsaw Massacre Wizare cart only 8
Tunnel Runner CBS cart only 8
Threshold - Tigervision cart only $10
Wabbit Apollo cart only 8
Winter Games Epyx NEW 3

5200

Zone Ranger Activision (NEW) $12
Gorf CBS (NEW) $7
Blue Print CBS (NEW) $7

7800
Water Ski - Froggo (NEW) $10

Coleco
Fraction Fever Spinnaker NEW $6
Moonsweeper Imagic NEW $6

Atari 7800 with 10 7800 cartridges
---------- $50

Asteroids, Ballblazer, Choplifter, Donkey Kong
Food Fight, Galaga, Karateka, Realsports Baseball
Winter games, Xevious

and 10 2600 cartridges.

Battle Zone, California Games, Galaxian, Enduro
Joust, moon Patrol, Ms Pac-Man, Pac-man, fall!
Tennis

(All cartridges are new in the box - includes one 7800
controller, power supply and tv switch)

Faichild new in box with 5 cartridges. This unit has the removable
joysticks. Most of the cartridges do not have the boxes and
instructions.
Fairchild and 5 cartridges Starting Bid
---------- ---
$30
#1 Tic Tac Toe
#3 Video Black Jack
#4 Spitfire
#9 Drag Race
#12 Baseball

Colecovision and 15 cartridges $40
---

includes 2 controllers, power suppltch box
and 2600 converter.
(Also included, but not tested, are one roller controller,
2 super action joysticks and one driving module.)

Carnival
Cosmic Avenger
Donkey Kong
Donkey Kong Jr
Gorf
Lady Bug
Looping
Mouse trap
Popeye
Q*bert
Subroc
Time Pilot
Turbo

Venture
Zaxxon

Vectrex

Vectrex in good working condition with one Joystick and the
following cartridges:

Armor...Attack Starting Bid
Berzerk ------------
Blitz $70
Clean Sweep
Scramble
Star Trek

Atari XE games system $30

This is the games box only. It has no keyboard. It is in
excellent condition. Includes the power supply, switch box, one
original controller and one Atari controller. Also includes are
six XE games. All are new in the box with instructions except for
Bug Hunt which is Cartridge only.

Bug Hunt
Barnyard Blaster
Hardball
David's Midnight Magic
Boxing game (Fight night)
and one other

3586. Paperclip Wanted (maybe).

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-20 13:02:20 UTC
From: A644690C@vax.edinboro.edu
Message-ID: <01H34Y4H6CP28WWIX7@vax.edinboro.edu>
Source record: 104895

I am interested in picking up Paperclip, but I'm not really sure yet.
I have several papers to write in the near future and I need something
with a good (and easy to use) spell-ckecker and the ability to do a lot
of formating (super/subscripts, underline, bold, headers, footers, italics,
etc.).

I have been using AW+ for a log time but I can't stand the spell checker.
If I copy the entire dictionary to a disk-image on my MIO, the speed is
OK, but the user interface still sucks. I also dislike the bank-selecting
in AW+. Is Paperclip any better??? I've heard many good things about it,
but not about many specific features.

Anyway.... I am interesting in buying (or trading) someone for it if anyone
has it to part with.

Also: I've decided to try an collect more application software. I bought
SynCalc for $5 the other day and I think its great (MUCH better than
VisiCalc). The only problem is that I wish it would graph. What other
Syn..... Products were made?? I'm still looking for graphing and
DataBase software.

Thanks,

-Adam Conover.

Adam,
Like most things in life, "better" is subjective. I prefer Paper Clip
over the other Atari word processing programs. It has a few unique
features such as split-screen editing, 80 column preview, etc. It came
in 2 versions--Version 2 (I believe) would only run on a XE130 (or
a memory upgraded 800XL) and had a spelling checker. It has drivers
for most printers and a program to build a custom driver if needed.
On the minus side, it uses it's own DOS, so you are limited to single
density storage. It has more bells and whistles than I've been able
to fully utilize. I have version 1.0
As far as the "Syn" series of programs, again I have my biases.
They are some of the best of their genre. Syncalc had a companion
package known as Syntrend. It allowed you to graph, make pie and
bar charts from Syncalc data. It also included a statistical
package. Synfile + was Synapse's Database program. It was quite
flexible and powerful. There were a few other Syn programs.

Synchron was a calendar/appointment program. Syncomm was a terminal program. Synstock would analyze your stock portfolio and identify trends. Syntax was a program for figuring your individual income taxes. ***
Synapse had quite a few neat games. As I remember, they had some sort of deal with the old Atari that was cancelled when the Tramiel's took it over. I believe Synapse sued Atari but then went into bankruptcy. I never heard what finally came out of the lawsuit.

Sorry, I have a problem with spelling. In fact with the english language in
general. Do to brain damage a birth my brain just jumbles up letters and
words. So in the future, if you see a sentance like:

I have I game called Star Radiers
instead of
I have a game called Star Raiders.

Don't worry, its just me.

Peronally I wish Vi had a grammer and spell checker built in. It was the
only way I made it through college..

Ah, Montezuma's Revenge. One of the primo 8-bit pre-Mario run and jump games. You're this guy stuck in an aztec vault with multitudes of rooms. Each room has some type of monster (not all): bouncing and rolling skulls, random moving spiders, electrified walls, disappearing/reappearing bridges over flame pits, etc. Very addicting game, got all the way to the stomping idol and back, but could never finish the game. I still have my copy, and I wouldn't sell it for anything...

The color signal comes off of the GTIA chip (U17) and is then applified by the cirucit containing transistors Q2, Q4 & Q5.

Assuming you have no mechanincal problems (ie bad cables, connectors) the GTIA chip would be a good place to start.

>anyone ever finished it?

The game was released for several platforms if I recall. Anyway, I
don't seem to recall an ending. You would go through a lot of caverns to
retrieve some item (idol?), and then bring it back to the starting screen
if I remember right. Then you would fall through a bunch of diamonds and
start over at the starting screen again, at a higher level. The higher
levels featured more screens (you'd walk over bridges of fire). Also
you had to retrieve a torch on the higher levels. Without the torch,
the walls were invisible, thus you could easily fall of ledges, run into
enemies, etc, until you had it. And you have to cross through a very
difficult room of ledges (which are all invisible!) to get to the
torch. I believe you received a new life every 20,000 points or
so. Also there were sticks (which made you invincible for a short
period of time), and some item which allowed you to kill the rolling
skulls. It's too bad that there wasn't a screen editor for the game,
that would have made it really interesting. At some point there might
have been an ending, but I doubt it. I never made it beyond level 4.

|> Hey Jeff.. @are to give us the latest on JView? :) It sounds VERY @ool.

I have two guys on GEnie who I've given Alpha copies for review and feedback. They've caught some bugs that I'm starting to fix. Basically the program uses too much RAM (I've backed the load address down to $2600 I think, which is pretty low for some people). I want to add more features but I've run out of space. Already it does:

- Direct from GIF to ColrView (CV) mode decoding (thus 3x faster since you don't have to create three files one at a time)
- Creates GR.9, 15, and (new) 8 CV pictures
- Uses 4x4 dither patterns for even more simulated colors
- Saves as three files (.R/G/B) or one big CVSquash file with caption
- Also does monochrome GR.9, 15, or 8 decoding of GIFs

I'm going to have to resort to loading program modules, so you can only exercise some of the features before you have to reload routines from the master disk.

|> (This is to Jeff Potter, everyone). Hehe.. what's the "J" stand for? ;)
|> (Hey, we've got *BOB*-Term! hehe!)

You guessed it.

|> Anyways... I don't wanna say mu<h, but I HAVE had ONE image that looked
|> better in .PZM :).. only one. JView sounds mu<h needed.

Yeah, on rare occasions the APAC/ILC image looks better. But that's only on monitors with comb filters.

For you technical types, here's why I think APAC mode worked:
Some monitors/televisions use a comb filter to remove the luminance and chrominance signals (necessary before you can drive your red/green/blue electron guns. A comb filter relies on the fact that the chroma signal is encoded as a phase shift of the color carrier, a 3.58 MHz signal that "rides on" the luminance. On standard NTSC TV signals (to which the Atari does not comply), the phase of the chroma signal changes every other line by 180 degrees. So if you digitally stored one line of the signal and summed it with the next line coming in, pixel by pixel, the chroma signal would entirely cancel out, leaving only the luma. This assumes the picture doesn't change a whole lot between successive lines. If you subtract the next line coming in from the previous line, the luma will cancel out, leaving the chroma separated.

On the Atari, when outputting APAC, every other line is a 16-level "luma only" signal, and the lines in-between are 16-color "chroma only". If

you add these together, and low-pass filter, every line coming out has the luminance produced by the GR.9 line. If you subtract these, the chrominance signal will come from the current (or previous) GR.11 line. So it ends up averaging both lines together in a way that gives you 16 colors * 16 intensities.

When APAC doesn't work on your monitor, most likely you don't have such a comb filter. An industrious guy could design one as an option though...

I don't remember anything about any idol... O' course, the version I had (might still have it, in fact *gasp*) was a very pirated (I presume) version with the title "Preliminary Monty 16k"; looked very unfinished. As I recall, though, you did fall throught a bunch of diamond filled rooms at the end of each level, then you were dumped into a (very slightly) different level. My sister made it to level 9, I think. My version must have been buggy, though, because there were quite a few rooms which had weird entrances/no exits/were just generally WEIRD... Still a GREAT game :) I guess nobody wants to sell their copy? Thought not...

The only Atari 8-bit emulator I have seen is for the Atari ST. Recently, Darek Mihoka (the creator of the emulator) also created an Atari ST emulator for the PC. The latest version of the ST emulator (Gemulator 3.0) supposedly will also run the 8-bit emulator software. I'll post a message as soon as copy of 3.0 arrives as to compatibility.

In a nutshell, if you want to emulate an 8-bit on your MeSsy DOS machine, you need to emulate an Atari ST, which ion turn can emulate the Atari 800. As far as emulation on a UNIX box, I've heard someone is working on an X-Windows version, but it has yet to materialize.

>But, most of the dog fighting is limited to a slanted hexagon plane,

I hadn't noticed this. I'm not sure if the Amiga version is the same.

>the ships are all spheres (noticed that you can score a hit NEAR the
>ship but only appear to hit space)

They may have tried to change this, because I notice the opposite. If I don't fire at the center of the object, I won't hit it at all. It's especially bad with the big Ralari and Fralthi ships. The 'sweet spot' is probably only 1/4 or so of the ship's size.

I found this annoying.

>Plus the graphics of the ships rotate in quick jerky angles.

Especially the larger ships have a limited number of rotations. In general, I think I liked the trade off for the extra detail versus the smooth rotations but simple shape of 3D polygon models in other games. And it still gives a nice feel for where the ship is going, and that it is a *real* ship instead of the 2D static images that were in Star Raiders.

>Maybe the amiga version has cleared these
>problems but these small anoyances make me like Star raiders more

Probably not much. There's still things that bother me.

So..... why is it @alled fli<ker term?

And does it use Itay's 80-@olumn-style s<rolling for speed or a 2k Gr.0 map? (my idea :)... the name fli<ker reminds me of what my idea would probably end up looking like if it were done! :))

Speaking of hitting "empty spa<e", Star Raiders seems to let you hit a
ship no matter if you just laun<hed a photon (it's big and @lose to the
side/bottom of the s<reen), even though the enemy appears small and
distant...?

Did they (he) just use P/M @ollision dete<tion?

Then again, sometimes that DOESn't work!? Hmmmmm

Damn! Were the files from the programs inter<hangable? That'd've been
REALLY neat!

I'm not at ALL good at programming or even USING any type of
business/produktivity software, so this is pretty intruiging to me! :)

I have Rastan and Double Dragon for the sega master system that'll trade
for the system.
I really want the system so if this isn`t a good offer, I'll try to
bet the best.

I don't know if version 2.0 is limited to single density or not. You
might try TOAD computers. About a year ago, they had 2 copies of
Paperclip (I'm not sure which versions). They recycle a lot of 8bit
software. They have a toll-free order number 1-800-448-TOAD.

P.S. That hardware key was called a 'dongle'.

Yes, the files were interchangeable. The different packages were
designed to work together. Visicalc files could also be used. Synfile
and Syncalc had a similar 'look and feel', so that when you mastered
one, the other came naturally.

3618. Indus GT question

Newsgroup: comp.sys.atari.8bit

Message-ID: <19930921084944MIS0160@MVS.UDEL.EDU>
Source record: 104926

My brother gave me an Indus GT disk drive minus power supply. I have an extra Atari CO17945 power supply from my 1010 Data Recorder. My question is, "Can I use this power supply with the Indus". I believe both the Indus and Atari use a 9v power supply.

opps.. sorry all, that was suppost to be private mail. Anyways, I saw the
xe game system doesn't have the keyboard so I don't want it. Just wanted
to add that so I wouldn't persuade anyone from not offewring to buy it
from him.

>-Adam Conover.
> a644690c@edinboro.edu

These are the Syn - products that I know of:

SynCalc
SynFile +
SynTrend
SynComm
SynChron
SynStock

Finding *any* of these may be extremely difficult however.
I may be wrong, but I was given to understand that Atari
had purchased the rights to these programs for the 8-bit,
so it doesn't take much imagination to realize that these
products are probably dead in the water.

SynTrend would be the product you are looking for specifically.
It is actually two separate programs - Syngraph and Synstat.
Syngraph charts scatter plots, bar graphs, pie charts or
line graphs, while Synstat does regression analysis, means and
standard deviations. What you wanted to know is this:
You can also graph datafiles from SynCalc, SynFile + and that
old dinosaur VisiCalc.

I'm sure someone else here will be able to fill us in on the
availability of the products above, and/or the use of some other
program that is compatible AND available.

Good luck.

Let me try this again. I have version 2.0 Paperclip, and it does support
double density. I use it to write the DOC files for my shareware, and
the doc's are all saved on a double density formatted disk!

>So..... why is it @alled fli<ker term?

I NEVER said I was working on Flicker Term! If I recall, in that same
message I said I _WAS_NOT_ working on it. (sigh)

>And does it use Itay's 80-@olumn-style s<rolling for speed or a 2k Gr.0
>map? (my idea :)... the name fli<ker reminds me of what my idea would
>probably end up looking like if it were done! :) )

I do not know exactly the way Itay is doing things but here is how I have
my 80-column-style Graphics 8 display list set up:

DISPLAY_LIST:
3 Blank Line Instructions
LOAD Address Graphics 8 line
7 more Graphics 8 lines
LOAD Address graphics 8 line
7 more Graphics 8 lines
.
.
.
LOAD Address graphics 8 line { Repeat these 2 steps 24 times total }
7 more Graphics 8 lines
LOAD DLIST Address

I also have an offset table which looks something like this:
TABLE_ONE: ; Offset into Display_list for LSB/LSM
.byte 4,14,24,34,44,54,64,74
.byte 84,94,104,114,124,134,144,154
.byte 164,174,184,194,204,214,224,234
LoadData: ; X contains what line number you wish to load pointer for
LDY TABLE_ONE,X
LDA DISPLAY_LIST,Y
STA $CD
INY
LDA DISPLAY_LIST,Y
```

```
STA $CE ; Pointer to 320 bytes of line through ($CD)
RTS
Zero_320: ; ($CD) points to location to zero 320 bytes (1 80 col line)
LDA #0
TAY
?Z3_L1
STA ($CD),Y
DEY
BNE ?Z3_L1
INC $CE
LDY #64
?Z3_l2
STA ($CD),Y
DEY
BPL ?Z3_l2
DEC $CE
RTS
```

Just some routines that would show how things are done etc...
Scrolling the screen is merely a matter of saveing the first line
address in a safe_spot, moving the rest of the data up to the previous
LOAD Address graphic 8 line, zero out 320 bytes, stick the saved line
into the last LOAD Address graphic 8 line. So to scroll the entire screen
you merely copy: (23 lines)*(2 bytes per line)+(Top Line)*(2 bytes)*(2)
= 50 bytes copied { since top line must be saved } and zero out 320 bytes.
Alot faster than moveing (23 lines)*(320 bytes per line). :)
I would think Itay would use this method if he wants his screen to be
able to handle 2400 baud scrolling.

Blah,
-BRiT

>anyone ever finished it?

What's all this about an idol? I won that game from some contest I entered and it had no stomping idol. You worked your way to the last door in the dungeon, and then you entered a treasure room where you could collect lots of jewels. This took you back to the start of the game. The only thing that made the levels harder was the speed of the nasties, and the level where the darkness began (remember the blackouts until you got a torch?).

The version I have is the 16K version of the game. I have also seen a 24K version. The game play looked identical, but the graphics were a little nicer. Is the stomping idol in the 24K version? If so, when does it appear? Did Parker Bros. release both versions or was the 24K version released by someone else?

Speaking of games that were hard to finish... Did anyone ever get to the end of "Trolls and Tribulations"? I got close, but never quite made it. How about "Conan"? I hated the game play and gave up rather soon on that one.

Hehhe... APA@lopedia up there or what!? :)

A<tually, the ONLY reason the pi<ture looked better in APA@ than in @V9
(it A@TUALLY looks even BETTER as a straight 8k Graphix 10 image! :-))
is be<ause it's of a drawing of a red pors<he... so you @an guess how it

looks in @V9! Very... wavery!

The reason I was able to xvert it to Gr.10 mode is b/@ the brightest luminen<e was.... . 8! Lowest was 0, so I set the palette @olors 1-8 to be reds, and 0 to be bla<k! So it looks brighter than the A APA@ version, and takes 1/2 the spa<e, and still has mixed @olors (reds and blak!)...

@an't do THAT with graphix 9!

then again, this is the FIRST good use I'VE @ome up with graphix 10!

Ever plan on making a 9 x 9 x 9 @V10 mode?

or a 9 x 9 Any Point A-lot-of @olors mode? heheheh! ;)

Mr. Fixit (timuszyn@jupiter.cse.utoledo.edu) wrote:
: Kept forgetting to ask the general populous here,
: what type of Atari 8-bit (800/1200xl/xl/xe) emulators are out there?

: (What computers do they run on? What minimum system requirements are there?)
: (etc.)

Your in luck- run out and buy an amiga. The Emplant, a multi-purpose
all-in-one emulator now runs a MacII cx on your amiga, and the creator
of the board was an old 8-bit hacker, and promises an 8bit emulator for
FREE. (WHen you buy the board.) Its not out yet- the 8bit rmulation- but
the Macii is, and they are working on a 486 emulation next.

He claims it will eventually do:
Apple IIe
Atari st/8bit
SNES
Genesis
'386/486.

Right now, it runs the mac at a faster speed than a comparable mac.
IE- faster than a REAL IIcx.

I have two versions of Montezuma's Revenge...

One is about 34K in size, released by Utopia and credited to Robert Jaeger. It has a large title graphic and a theme song (sounds much like the theme to "The Dating Game", but I think it's something like "Spanish Flea")

The other is 14k, released by Parker Bros. No music and the maze is different (matches the Apple II version).

No doubt. And I thought placing my own external routines to load at
$2000 was high. :) Even with disk_based SpartaDos I've almost always
had lomem below $2000 with RS232 and RAMDISK loaded and installed.

And now after using SDX with USE BANKED, $2600 is extremely _HIGH_
nearly 4k+ higher than what I like. :)

RE: Jeff Potter
I dont suppose you'de care to make your programs relocatable? (grin)

BTW: I cant even imagine what the size of your correction_table would be for
that. I've done my own relocatable code, but the largest size Ive
dealt with is something that compiles down to 5k+. It wouldnt be
all that bad if you only had to deal with data, (double indirection)
but when the actual code has lots of subroutines etc... it gets harry.

Does somebody know how cartridges are electrically conected to the atari?

Have anybody of you, hardware guru's, designed and attached a home-made cartridge with your own software? If you know how to do it let me know. It could be very usefull. Feel free to email.

If you are using batteries, you can bypass the linear regulator and use a diode
to get from 6V to 5.3V or so.

> >requires 9V AC so a 12 volt battery would be recommended there. I think

> The 9 volts AC for the disk drive is just for simplicity. The disk

> battery and a 12 volt battery are being supplied by splitting the regulators
> in the disk drive, providing low drop out regulators for both, and driving the
> diskm drive 5 volt regulator from the 6 volt battery.

The +12V is used to power the disk dirve sorvo motors. If you have a
XF551 type drive you can replace the old floppy with a 5V only floppy
drive. Otherwise you need a dc/dc converter that uses +5V in and puts
+12V out. These devices are very efficient 65% (linear supplies are 30%
efficient).
Again, batteries put out a fixed voltage (until they start to die) so
a regulator is not required.
Also you need to consider the current required to run an atari. These
computers were designed to be cheap not efficient. My 130XE power
supply puts out 5V at 1.75 amps. A set of 5 1200maH nicads would power
the computer for about 30 minutes. The disk drive would require its
own set of batteries. These batteries would last any where from 10
minutes to several hours depending on how much the disk was accessed.
I tried using batteries on my 400 almost a decade ago and it didn't work
and I'm not sure why...oh yes I remember now the memory required
+12V and cheap dc/dc converters weren't available at the time.

Good Luck.

Mike

I've also another Shareware Macro-Assembler right here. It's written by
Torsten Karwoth and is really a blown up thingy. It runs on machines with
at least 128K, makes use of Makros, has its own decent editor, you can work with up to 96K
of source-code. It also provides its own BATCH language for MyDos.
It's called "130XE+ Macro-Assembler"

I haven't had the time to play around with it too much, but it is THE most
popular Shareware Assembler over here. It comes with a full disk side of docs,
in German of course. Anyway, I'll upload it to the archives right after my Maths exam next
week.

I posted this locally last time, so you probably couldn't see it. Has anyone managed to transfer Fred (by Zeppelin) to disk using Transdisk (or any other method)? If so, how? Also has anyone come across problems with Transdisk regarding creating dead files which can't be erased? I did some at the Weekend and now I can't delete or overwrite these files...at least not from Transdisk...I've only got DOS2.5 (which is not compat with Transdisk) so deleting from dos is probably not the answer...

Zargwog.......

"Happy Computer" appearing on the TurboBASIC XL title screen was the name of
a computer magazine from "Markt&Technik" publishing.

This magazine doesn't exist anymore, it died around '89 or '88.

The magazine was dedicated to various computers like C=64, Atari, Amiga, etc.

BTW: TB XL still isn't PD in Germany! Markt&Technik doesn't want to release
it to PD. They even refused to sell the rights to ABBUC, the biggest
Atari 8-bit user club.

For battery operations, using a 7805 is NOT recommended. You'll have to use a switching ps for the battery for battery life. Also, it's recommended that you replace as many chips (if possible) with CMOS versions to get a little more life.

The guy that wrote the Atari ST emulator (Darek Mihoka) also created a PC
version, but it was never released due to low response from the PC
community. Maybe someone could encourage him to release it. I believe
his e-mail address is darekm@microsoft.COM

Ugh... sorry... heard many strange/bad things about the hardware in an
Amiga. The 68k processor is fine, but Amiga ROM makes the machine into a
nightmare. This reminds me though, a while back, someone was working on an
emulator for the ... ST I think... would emulate:

Atari 800
Atari XL/XE
C64
Mac
limited IBM
and something else... forget what.

Does this ring a bell for anyone? Do you know what it's called? How much?

thanks anyway,
Tim

>etc.).

Unless there is a newer version of PC out, your desired feature list
doesn't match with what PC offers.

I used PC for one paper a few years ago. PC has no automatic footnoting,
and I spend so much time reformatting things after making a change that
I went out and bought a 2-floppy IBM clone just so I could run
WordPerfect.

Do yourself a favor; if you're serious about needing to do papers, go
pick yourself up a used XT clone and a copy of WordPerfect. Even an old
version will beat the pants off of Paper Clip on a 40 column screen.
Use your Atari for the fun stuff. ;-)

Yes, that someone would be me...
Unfortunately, I've had barely a spare minute since college started
again this fall. So, I've only been able to put in a few hours total
to work on it in the past 6 weeks or so. However, as it happens,
I'm sparing about 2 hours right now, and I'm hoping to somehow have
this wrapped up within a month and published out to the net.

My only other major complication is the fact that I don't have
access to any fast color machines anymore, only slow ones that
do 4-level grayscale. (ugh)

So, people on the net might need to make color corrections and
send me the results (although hopefully my original code for the
color will still be correct)

But he could release the emulator 'less ROMs' and let the faithful
8-bitters dump them from their machine. Apparently that's how many
of the Apple][emulators get away with it.

3650. Black Box & CSS

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-23 03:45:10 UTC
From: timuszyn@jupiter.cse.utoledo.edu
Message-ID: <1993Sep22.224511.6165@uoft02.utoledo.edu>
Source record: 104811

Just received the C.S.S. 1993 catalog in the mail today... couple questions tho for current uses of the black box and/or floppy attachment:

1. Only SCSI controllers can be used with this unit? What the heck is SASI?

2. Can other SCSI controllers commonly used by IBM and clowns/clones really be used by the box?

3. He writes, quote from Hard Drive Systems page 10, "Prices start as low as $399...". Ouch! Is he talking about the Black box unit with 64K buffer, hard drive controller AND hard drive for this amount? I've seen stable, used 20 Meg drives going locally for about $20-30. Controllers... old SCSI's for maybe $40-50... maybe less, don't remember. Any idea? I can't call up his BBS since my old P:R: connection died again... 3 modems, one link to the computer *#%!*!#$

4. Each floppy drive accessed through the floppy board can be used as standard "Atari" drive, right? The disks formatted and written to by say a 360k 5 1/4" in "90k SS/SD" mode CAN be read from an old 810, right?

5. "Built-in to the Floppy Board are our Black Box Enhancer (see next page) and a version of our Super Archiver to allow copying of protected disks for 3.5 inch format." Uhh, wait a minute... I remember reading years ago that ALL floppy drives attached through this unit would have Super Archiver capability!

6. "Floppy Board drives are addressed differently than external drives..." Uh-oh... let's say I hooked up two 1.2M 5 1/4" drives to the floppy board. I format a couple low-low density 90k SS/SD disks to stay compatible to a couple old drives and try to boot from these drives treating them as D1: and D2:. I CAN do this, can't I?

7. This is odd: 600XL, 800XL, and 130XE computers are supported. What happened to the 120XL? 800 is out of the question I think...

8. If I decided to get a modified OS from Newell, any known incompatibility problems? Lock ups? Certain modes to avoid?

9. How about any reviews on the Ultra Speed Plus OS? Worth the money? Newell's better? Faster? (with DMA on, Newell vs. Ultra Speed OS?)

I'm looking for any reviews, good or bad, from existing users! Please respond here or e-mail... preferrably here! Hopefully we might get other users interested in purchasing some newer 8-bit equipment. (supporting C.S.S. - this way, maybe it'll encourage Bob to come up with some new mods/etc. for the 'ole Atari 8-bit - (not that he isn't already))

-Tim

3651. EPROM -=> MYDOS?

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-23 03:54:45 UTC
From: timuszyn@jupiter.cse.utoledo.edu
Message-ID: <1993Sep22.225446.6166@uoft02.utoledo.edu>
Source record: 104812

A while back I posted an article briefing mentioned that it would be nice to have MY-DOS on a cartridge to "instantly" boot from. I believe I had a couple encouraging followup's showing that many people would be interested in such a beast. To date though, I'm sad to report that no one has stepped forward with an old EPROM burner willing to set MY-DOS to silicon. In the new CSS catalog I was browsing, I recall seeing an add for some "Super EPROM-Burner" that plugged into the cartridge port.

Anyone happen to own one of these? Anyone knowledgeable enough to burn some PROM's (not EPROM's) for use in/as Atari cartridges? I know a bit about burning EPROM's (and PROM's), but not quite enough... also, I have no device available capable of doing such. How many "interested buyers" would you need to make the effort worth while? About how much do you think the chips alone would cost you to burn?

Anyone familiar with the whole process of burning PROM's, setting the chips and circuitry, and making a totally independent CARTRIDGE? SpartaDos has their X, why not a MYDOS X?!?

HELP!

-Tim

I'd like to hear more about this. Especially since I won't be able to read
the German docs. :-(Do you know if it can assemble 65816 opcodes? Does
the program reside mostly in the bank select RAM? How much main memory is
taken up, and where? How do you define a 'decent editor'?

Thanks,
John Harris "My satellite went to Mars,
jharris@cup.portal.com and all I got was this lousy T-Shirt."

>taken up, and where? How do you define a 'decent editor'?

Well, I could TRY to translate the docs later, but it's quite a lot.
I got it with a printed 37 page or so documentation. Unfortunetely I lent it
out to someone who hasn't given it back to me yet.
With that docs I could've anwsered your questions easily. What I'm quite
sure off is that M-A 130XE+ can't assemble 65816 opcodes.
I've forgotten about the exact RAM management as well. Once again: I'll tell
you when my docs will be back. I remember that quite a bit of the program
reside under the OS (with parts in the additional RAM ?). I'll check for this.
There are also some extended memory testing programs included checking not
only the presence of extra memory but also its timing necessary for
propper functioning.

As to the editor: it offers real time syntax checking, so it's rather an
interpreter than an editor :-) (well, not exactly).

Like I said in my previous post, I didn't have the time to explore the system
thoroughly, because I don't have an 8-bit Atari here (it's 100km away).
Nethertheless this assembler works well for many people over here.

I could've uploaded it right now if there weren't this stupid "Liberty" virus
on the only working IBM with 360K drive. UTIL just crashes with "Liberty" in
the system. I guess both programs interact on a very low level :-)
Anyway, I'll try later. Be patient, we've got a little chaos here.

-Marek

>nightmare.

You obviously know nothing about the Amiga, so why not take the polite route and just stick with what you *do* know? Thank you. In point of fact, the way the Amiga works is a prime reason why Emplant (the emulator previously mentioned) works as well as it does. If the Atari 800 emulator works the same way the Mac emulator does, you'll be able to run Atari software in real-time at the same time as your Amiga software, using the Amiga's multitasking capability. Doesn't sound like a "nightmare" to me.

Now, if Jim Drew would only get it *finished*... :-)

|> Use your Atari for the fun stuff. ;-)
|>

I used Paperclip 2.0 (130XE version) through most of college. The main
difference between the 130XE version and the 48K version is the spell
checker and the size of the text buffer (if you have a RAMBO XL,
you can load the entire spell checker disk into memory!). I can tell
you without a doubt that Paperclip 2.0 has all of the above abilities
and much more. The ability to do things like superscripts, underline, bold
and italics will depend on you finding a compatable printer driver in the
list of printers (or creating your own). It also handles headers, footers,
hanging indents, table of content creation, included files, and a host
of other features. I never found the 40 column screen to be a problem,
as Paperclip handled all of the page formatting anyway (there is an 80
column page preview mode if you must see it before printing).

If you really NEED 80 columns, I would pick up a used ST as oppossed to an
XT clone (at least, that is what I did).

|> >Yikes, $2600 is considered low? What takes up that much low memory?

Well I actually backed it down to $2500. I seem to remember Bob Puff or someone advising me to keep it above $2800. Some DOSes want to use that for disk buffers, other things. Remember I still need to do disk I/O. I'm open for advice here.

|> RE: Jeff Potter
|> I dont suppose you'de care to make your programs relocatable? (grin)
|>

I don't think that would help. When I said I backed it down to $2500, I meant I use practically all remaining memory, including most of the RAM under the OS in an XL/XE. I doubt I have a contiguous page of memory left anywhere. The executable code is somewhere in the 8-10K range, but GIF decoding (and general graphics work) forces me to reserve sections of memory. I already re-use the area that gets cleared out for player memory.

BTW: have people experienced flashing screens while decoding GIFs (in APACVIEW) from RAMdisk? Do their RAMdisks allow Antic banking? Is there a good way to detect/avoid this anomaly?

SASI is the predecessor to SCSI. SASI == Shugart Associates Systems Interface (as I recall), SCSI == Small Computer Systems Interface. Quite similar, electrically and logically, but at least one line is defined diferently (I believe in SASI it is level sensitive, in SCSI edge triggered) and I also suspect that SCSI allows more in the way of logical commands, being more developed.

>

Not SCSI controllers used in the PCs ... SCSI controllers used on the drives. IE -- you can use a SCSI drive that could also be used on a PC, which is actually a combination of drive and controller sold as one unit.

This question of ROM's and emulators has come up before, in the Sinclair Spectrum market. One emulator author solved the problem legally by including the ROM's but pointing out that only people who actually OWN this machine could legally use the emulator. If you own the ROM then you are able to use it. Fair enough.

Really, though, this is stupid. Atari dumped the machine like a hot brick years ago (apart from Italy it seems, where a new ROM cart is available). Why are they still trying to protect their copyright when they don't use it themselves? This opens up the wider question of why they are not releasing withdrawn software to the public domain, too.....but that's another flame-war....

Zargwog

3660. Trade MT-32 for Atari stuff

Newsgroup: comp.sys.atari.8bit

In a few days, I should be getting a 65xe in the mail, sold to me by someone on the net. As I understand it, it doesn't come with much. So, I'd like to get this system into a state where I can program it in assembler.

To this end, I'm putting up my Roland MT-32 and PC-MIDIQUEST card as a trade for a package of Atari goods that will get me started. I was thinking along the lines of :

1 floppy drive or two
Ram upgrade? (if this exists to bring the 65xe to 128k)
An assembler, natch
misc games
joysticks
modem (300/1200/2400)
misc software
misc magazines or books

Also, what exactly do I need to get started? I'll be using my TV as a monitor for now, since I assume the 65XE has an RF modulator.

Markus

3661. Magnavox RGB Monitor-80(Color composite+RGB+audio)

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-23 16:51:58 UTC
From: cohen@GOMEZ.phys.virginia.edu
Message-ID: <00972F98.E3B2F640@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 104826
Cross-posted to: comp.sys.cbm,comp.sys.atari.8bit,comp.sys.apple2.marketplace

Monitor for sale-

MAGNAVOX RGB- MONITOR 80, with
Composite AND RGB CGA, both color and green monochrome modes.
The model # is CM8562 074G.
This monitor has composite color input, Audio input, RGB TTL (CGA video) input,
CVBS/VCR button, and is dual mode color/green monochrome push-button switchable.

This is useful for VCR, computers with composite output, CGA as well.
Good for 80-column applications.
C=128 owners can use the RGB mode (similar to the C=1084 and C=1902 monitors).

THE ***PROBLEM*** with this unit is that colors at the very upper (I would
say 10%) portion of the monitor are not true (the rest of the screen has good,
true colors).
If you think that you can live with that problem, or better yet, if you think
you could fix it, or if your application calls for monochrome display most
of the time, then please consider this monitor. Apart for the problem indicated,
it is an excellent unit.
I would like to get $50 for this unit, or a reasonable offer.

Please e-mail to address COHEN@GOMEZ.PHYS.VIRGINIA.EDU or call (804)293-8973
in case you have no e-mail account (prefer e-mail). Thanks!

Bob's system package includes (I'm doing this from memory):

Black Box (not sure if this includes the 64k buffer, I'd guess no)
Hard Drive
Drive Case
Power supply
Cabling

Considering the BB alone is $200, an additional $200 for a drive, case, PS
and cables doesn't seem *THAT* out-of-line for new equipment. If you've
seen 20MB drives going for $20-$30 I would guess that they're probably MFM
or RLL drives, not SCSI, and will require another controller card to enable
the drive to talk to the BB. I'm currently pricing used SCSI drives in
the Toronto area, and the best price I've come up with so far is US$55 for
a 40MB SCSI drive. But since I'll be sticking this in a PC case I have no
need for a PS or another case.

>D2:. I CAN do this, can't I?
>

No, you can't. Unlike a PC-clone, the 1.2M 5.25" can *ONLY* be used in high density mode. You can't read or write a DD floppy with a HD drive. Alternatively, you could do what I do. I have 2 floppies connected to my BB/FB combo - drive 1 is a 360kB drive and #2 is a 1.2MB drive. I can then stick any boot floppy in drive 1 and have the machine boot up just as it would from a SIO drive. I have a feeling you're misinterpreting "addressed" here. That refers not to how data are transferred to/from the disk but rather how the CPU determines which drive is which.

> 7. This is odd: 600XL, 800XL, and 130XE computers are supported. What
>happened to the 120XL? 800 is out of the question I think...

As Richard said, the 400, 800, and 1200XL have no PBI bus, unless you're into hacking on the 1200.

>

I like the UltraSpeed + (check out my column in an old issue of Atari Classics). The "Speed" part of UltraSpeed comes from its ability to read/write to/from disk at roughly 3x normal SIO speeds if you have a drive which supports US mode (XF551, US Doubled 1050s, etc.). And you can implement this even if your DOS dosn't support US. I particularly like the US+ because I can set my RAMdisk to Drive 1 and boot from it. Really speeds up Infocom games, let me tell you! :-)

Anyone who's been following my exploits in Atari Classics will realize by now that CSS is probably my favourite company still supporting the 8-bit machine. Let's see, in the last little while I've bought a Black Box,

Floppy Board, US+ - I've still got my old "Impossible" for the 800 which I purchased many moons ago. And I'm think very seriously of purchasing their EPROM burner, as well.

Sigh. If only I made money as easily as I spend it. At least it's going to a worthwhile cause.

3663. Gemulator

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-23 18:44:38 UTC
From: gbennett@friendly.es.com
Message-ID: <27sqqm$qbp@cnn.sim.es.com>
Source record: 104822

I just got my Gemulator 3.0 upgrade in the mail yesterday. I really
haven't had a chance to try it out yet, but the new manual does
describe a new 8-bit emulator that will run directly on the PC.
Unfortunately those without a Gemulator board will be left out.
Apparently Atari 8-bit ROMS will have to be plugged into the board.
BTW, ST Xformer (the latest version of the 8-bit emulator
on the Atari ST) is to be public domain, and should be released
shortly.

: You obviously know nothing about the Amiga, so why not take the polite
: route and just stick with what you *do* know? Thank you. In point of
: fact, the way the Amiga works is a prime reason why Emplant (the
: emulator previously mentioned) works as well as it does. If the Atari 800
: emulator works the same way the Mac emulator does, you'll be able to
: run Atari software in real-time at the same time as your Amiga
: software, using the Amiga's multitasking capability. Doesn't sound
: like a "nightmare" to me.

Sorry about the way that sounded when I first msg'd... I do know a fair amount about the Amiga, and one of the drawbacks of the system IS it's ROM. It's a nice machine, but too much was hardware and ROM based instead of software based. It just had major problems in emulation of other system types because of this. Maybe they've fixed this, now that I don't know. Kudo's to them if they did. Sound's like multi-tasking is finally working right at least! :)

: Now, if Jim Drew would only get it *finished*... :-)

Now there's a problem we ALL have...

: Sorry, mate, not true. I should know, I program the damn thing ;)

... was a bit tired when I first wrote that... didn't come across the way I guess I meant it. The Amiga's, for a couple years when they came out, were mainly ROM based... To REALLY tinker with the bugger's, you needed to replace the chips and load OS and stuff from disk. Sounds like they've improved greatly from the "Wonder (if it'll ever get off the ground) years". Did they breach the old 4096 color barrier? Haven't heard much of anything about those things since about 1989.

My question is this. Who'd a<tually be interested in just a DOS.SYS on
@artridge?

Personally, I'm used to booting with DUP.SYS on D9:(ramdisk), so other
than DOS.SYS time and .ARx time (as if I have any useful Autorun's!), it
takes me no time at all to reboot.

And would the @art be like the SDX with "another @art port" on the end?

It is an intruiging idea.

Okay... Lemme see if I got it sorted out right.
The Black Box plugs into the 800XL parallel interface and gives you:

1) SCSI Controller with standard chain and passive termination.
2) Floppy controller for any regular PC floppies up to 1.44Mb drives.
3) Gives you U.S. Doubler emulation on these drives?

Questions:

1) The BB connected floppies are bootable drives? If you have drives connected
via SIO, which takes precedence?
2) The BB connected SCSI drives are bootable? How are they accessed?
What kind of compatibility issues are there here?
3) How much is just a plain Black Box with these interfaces?

A very interested,

3671. All change for the Nws-DISK

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-23 22:28:19 UTC
From: djg0@aber.ac.uk
Message-ID: <9309232228.AA02072@deca>
Source record: 104832

```
ALL CHANGE FOR THE NEWS-DISK.
=============================

As you may know, I am responsible for the disk-based newsletter called
"The Atari 8-bit News-Disk", or just News-Disk for short. This newsletter is
sent out on disk to subscribers, and is also available at the archive and
other sites. However, after 14 issues I have decided to change the format
completely, and publish it as a printed magazine. The name will, of course,
have to change!

The style of the News-Disk will be carried on into the new magazine. The
News-Disk is not ceasing production. It is just being developed into something
a little different.

There are just 2 problems.

1. It will, of course, no longer be available to download.

2. In order to make the printing costs feasable it will need to have a
minimum of 100 subscribers. This sounds like a bold expectation, but AC has
500, and Page 6 here in the UK has 5000.

This is what I need:

1. This posting copied on to as many BBSs as possible.

2. You to tell as many people as possible about the new magazine.

3. As many of you as possible to actually subscribe to the magazine.

Costs:

The magazine is likely to cost around $5 per issue by Air Mail.

Number of issues:

I will try as hard as possible to produce 6 issues per year. At first,
subscriptions will be on a 4 issue basis.

Other:

Other details are yet to be worked out. Advertising space will be allocated,
just like on the News-Disk now.

If you have no idea what the News-Disks are like then check out the Djg
directory at the umich archive. Issues 1-13 are currently on there called
issueX.arc where X is 1-13 (one of the issues is in .DCM format). If you
do not have access to these, then they can be purchased on disk from us
at DGS in the UK. The price is a very reasonable US$25 for issues 1-14.
```

Pay by sending cash in US$. Our address comes later.

The first thing you should do is either e-mail us pledging your support for the new magazine, or write to us pledging your support. If we can get about 75 people pledging support, then we should be able to go ahead with the plans.

E-mail: djg0@aber.ac.uk

>>

I have been meaning to ask, and this is as good a chance as any.
How do the high speed transfers work? Do the program the serial
bus for a speed other than 19.2 kBaud? Or do they activate something
like a streaming mode, where more than one sector at a time is read?
(Forgive me if this is in the FAQ)

Curious mind wants to know!

Well, not exactly. It was rather my old 2600 console. I picked up a 9V
battery (a NiCd rechargable battery, i.e.) and used it as a power source
for the console. It was quite funny. I discovered that the battery got rather
hot. I guess the current was a little bit too heavy for this little battery.
I could play with the battery powered console for not more than about
5 minutes.

As the battery got empty, you could notice a very funny behaviour of the
unit: the sound got distorted, the colors behaved strangely and the whole
RF-output faded away slowely.

Hooking up a battery to the Atari computer would require a high capacity
battery and, of course, a 5V regulator.

The most interesting power supply for the 8-bit would be some sort of a
switched mode power supply. You could design a unit accepting a wide range
of input voltages, say from 3V up to 40V, and providing a stable 5V output
to the computer. THIS would be VERY interesting.

Yes, but only if you purchase the Floppy Board add-on from CSS.

>3) Gives you U.S. Doubler emulation on these drives?

Sort of. ICD's US Doubler performed two tasks - it gave the 1050 true
double density (albeit single-sided) and UltraSpeed - increasing disk
access by a factor of three. The BB/FB combo goes beyond that by giving
not only US support but will support all drives up to high density/double-
sided.

You didn't explicitly mention it, but the BB also gives you a standard RS-232
serial port (whatever the hell standard RS-232 is), a Centronics parallel
(printer) port, and a 6502 monitor for examining memory contents.

>
>Questions:
>
>1) The BB connected floppies are bootable drives? If you have drives connected
> via SIO, which takes precedence?

The BB floppies are bootable (that's what I do now). You can specify which
drive you want to make D1: from within the BB configuration menu. This can be
either a BB/FB drive or an SIO drive.

>2) The BB connected SCSI drives are bootable? How are they accessed?
> What kind of compatibility issues are there here?

You can set a partition on the hard drive to be your boot drive, yes. The
documentation for BB states that they have not encountered a SCSI drive
which wouldn't work with the BB. As to how they are accessed - I'm not sure
what you mean by that question.

>3) How much is just a plain Black Box with these interfaces?

Basic price for the BB is US$199.95 + US$8 for shipping. For an additional US$50 you can get your BB with a 64kB printer buffer. The Floppy Board is an additional US$149.95. The CSS ad in the August issue of Atari Classics lists a BB/FB special price of $329 if you buy both together.

The address for CSS is in Michael Current's list of vendors, but for those of you who don't have it handy:

Computer Sortware Services
PO Box 17660
Rochester, NY 14617
USA

Phone: (716) 429-5639
Fax: (716) 247-7158
BBS: (716) 247-7157 (300-9600 bps)

I should mention I am in no way affiliated with CSS, other than being an extremely satisfied customer.

I'm not the techie type that should be answering this question, but I'm
not gonna let that stop me. :-) If someone else can provide more exact
information (and I know some of you can), please do so.

UltraSpeed is implemented by changing the skew on the drive when a disk
is formatted. By skew, I mean the order in which the sectors are laid down
on a track. In a standard skew the sectors are laid out sequentially:

-------------------------------------------------------------------------
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | ...
-------------------------------------------------------------------------

If you read a given sector (say #1) by the time the computer is ready to
receive the next sector the disk has rotated such that sector, say, 4 is
positioned under the drive head. This means the disk must make almost a
full revolution in order to get to sector 2. In an UltraSpeed skew, the
sectors are laid down differently:

-------------------------------------------------------------------------
| 1 | 4 | 7 | 10 | 13 | 16 | 2 | 5 | 8 | 11 | 14 | ...
```

You can immediately see the difference. In one full revolution of the disk you can read three sectors from the disk, rather than just the one sector you get in a standard skew.

I'm just winging it here, and I suspect that I don't have the skew worked out correctly, but you get the general idea. I remember reading a very thorough treatise on this once, but for the life of me I can't recall where it was.

Excellent explanation. You're mentioning this strikes a memory
chord .. I had dismissed the skew idea (from memory) at the time
as without thinking about I assumed that the 19.2 kBaud data rate
of the SIO would limit the transfer more than the skew would, but
I never worked thru any numbers.

Let me see now ... 19200 Baud ... 1920 Bytes (with start and stop
bits) ... 128 byte sectors ... 15 sectors per second, neglecting
communications headers and overhead.

Floppy RPM rate .. 300 RPM .. 5 revs per second .. so yeap ...
skewing would definitely triple the transfer rate. Or close anyways.

3684. Atari Software Public Domain

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-24 15:42:49 UTC
From: rdell@cbnewsf.cb.att.com
Message-ID: <CDv7nD.9wJ@cbfsb.cb.att.com>
Source record: 104844

My thinking about the sector skewing, and Atari firmware/Rom routines in general got me to thinking, and I would like the status re/copyrights cleared up in my head.

I understand Atari has released (in the US) _all_ of their 8 bit software to Public Domain. Is this correct?

And specifically, would this include the ROM routines and such? I think of this in reference to the Emulator posts that have crossed here recently regarding using ROM code in the emulator.

As well, have any other companies released their old 8 bit software? Perhaps a list of details should be part of the FAQ? (I hope its not there already .. my brain does get fuzzy and I do sometime skim past sections that don't interest me at the moment, but I don't recall it)

Just chewing over options as I slowly bring my home computer systems back up to snuff. Still four weeks from having a _real_ workbench Atari system. Just to drop a hint where my thoughts are headed ... I am contemplating a PBI bus to PC Parallel port interface ... something like the existing Serial interface for PCs, perhaps just modifying the drivers on each end to talk to alternate ports. Speed should easily be increasable by a factor of 20 or so over that of serial interface. But don't hold your breath. This is not the top of my overall priority list, and I do need to learn a lot of details re the drivers.

I found this little tidbit in an article on Nolan Bushnell in the October issue of Upside magazine ("The Business Magazine for the Technology Elite" - what a self-absorbed title!) and thought that you would enjoy this:

" 'Picture a bunch of hippies rocking to music, smoking pot and working like dogs,' says one former Atari employee, who asked to remain anonymous. 'It was crazy, it was fun, and the average age had to be somewhere around 25.' There were no dress codes and no official working hours - only an amazingly thorough health plan that Bushnell managed to swing because the average employee was so young. The company was living hand-to-mouth, and nearly went bankrupt time and again, but Atari grew nonetheless...."

I have to say that this nearly perfectly fits the picture of Atari I had imagined all of these years... They were simply the coolest :-)

Is UltraSpeed _only_ related to the skew?

My only exposure to it is with my SIO2PC setup, v3.01 and later support it (README says only to 38.4Kbaud, and that the US Doubler goes faster). SpartaDOS runs high-speed on all of my virtual disks, no matter what formatting (but, how much difference can skew make with non-physical devices?)

The skew will probably make little to no difference with virtual disks.
SIO2PC uses only the memory on a PC (unless you're using a newer version of
the software) and you won't have the same timing issues as you would with a
physical disk. When I did some timing tests on SIO2PC back in the February(?)
AC I found that my SIO2PC disks were giving me the equivalent of about
810 RPM, rather than the standard 300. And this was without US formatting them.

This just shows the benefits of using memory vs. a physical device. That's
one of the reasons a RAMdisk is faster than a floppy (although certainly not
the only reason).

You can, if you choose, set all of D1: through D8: to be HD partitions. As
far as making a partition bootable, all you need to do is do an (H) Write DOS
if you're running MyDOS or run the BOOT command if you're into SpartaDOS 3.2.

>It really sounds like a great product... I'll probably order one as I tend

[Stuff deleted]

Of course, a hard drive spins a hell of a lot faster than 300RPM so you're going to notice minimal difference if you start playing with the sector skew.

>a very nice boost, I think...

Well, the standrd skew of sectors isn't sequentially at all, Atari developers
weren't too bad on this. Nethertheless Mike exactly got the point with the
different scew for UltraSpeed.

Here I can speek only for the "Turbo 1050" upgrade I have, I'm sure this
is similar with other drive enhancers.

The "Turbo 1050" upgrade can behave like a stock 1050 and switch into the
UltraSpeed mode. The "stock" mode provides a sligtly different sector scew
than real stock drives. This gives you a little speed improvement, but really
not too much. Floppies formated in that mode will even run faster on
stock, not upgraded drives.

The UltraSpeed mode does more: the SIO bus speed is increased up to 70000 baud.
This alone doesn't improve the overall speed very much because even though the
sectors get out very fast from the disk buffer, you have to wait quite
long for the next sector to arrive. Therefore the sector scew has to be changed
to match the new SIO speed.

Now you have really fast access, but only combined with the 70000baud SIO
rate. When you try to read from this "high speed" formatted floppy while
in "stock" mode, it'll be even two times slower than with stock, old fashion
scewed floppies.

As you can see the sector scew has to be different for each SIO bus rate.

Things get different with upgrades like the "Happy 1050" or the "Speedy 1050".
These upgades have added track-buffers, like pointed out in the previous
post.

In this case the effect of a different sector scew is very minimal.
Now the higher SIO rate gets into effect. I guess the "Happy" will be

around 70000baud too, like the "Speedy" in the "Standard high speed" mode.
The "Speedy can go up to 90000-96000baud in the "High Speed Copy" mode, used
by the built in copy program. With the buffer enabled, the whole track
gets read in. In that case it isn't very important which sector gets in
first and which comes next.

BTW: the SIO bus rate can be changed very easily by modyfying the appropriate
register in the POKEY chip. Check the hardware manual for more details,
I don't have it handy.

Of course, a higher SIO bus rate won't work with drives not prepared for
speeds higher than 19200baud. You can try the trick with the XF551 which
is capable of higher SIO bus rates.

3696. DGS $20 BUNDLES

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-25 14:39:52 UTC
From: djg0@aber.ac.uk
Message-ID: <9309251440.AA27480@deca>
Source record: 104757

DGS Clearance bundles
==========

We are having a clearout at DGS HQ, and HAVE to get some stuff out of the way because we keep tripping over it! In order to get the stuff out of the way as fast as possible, we have decided to sell it in bundles and as cheap as possible. We have 6 of the following bundles to dispose of:

****
ATARI MACRO ASSEMBLER, EASY PROGRAMMING FOR THE ATARI MICRO BOOK, DIGI-STUDIO (OLD PACKAGES 1&1.5. ALL SOFTWARE EXCEPT THE NEW LIDS SYSTEM - 2 DS/SD DISKS AND 2 MANUALS), ONE BACK ISSUE OF EITHER PAGE 6 MAGAZINE OR ATARI USER (THE BRITISH MAG.) OF OUR CHOICE.

All the software is BRAND NEW, except the mags which are used.

PRICE: JUST $20 PER BUNDLE
===

THIS PRICE INCLUDES SURFACE MAIL SHIPPING FROM THE UK! (THE PARCELS WEIGH IN AT 1.2 KILOS SO AIR MAIL IS NOT REALLY A VIABLE OPTION. IF YOU WANT YOUR BUNDLE SENT BY AIR MAIL THEN ADD $15 TO THE PRICE).
****

Ordering info:

First reserve a bundle by email: djg0@aber.ac.uk

Then send US$20 in cash direct to us at DGS. Paying in cash is the easiest way to pay. You can pay by IMO if you prefer but these cost a fortune to arrange. Our address is:

DGS
62 THOMSON AVE
BALBY
DONCASTER
DN4 0NU
ENGLAND

Note: It is important that you send your $20 as soon as we confirm that a bundle is still in stock. We need a rapid turn-around on this stock.

Note 2: please note our address now. We won't give it again when we confirm your reservation by email.

We will put your bundle in the post the same day your $20 arrives. Delivery by surface mail should take about 6 weeks to the US. Delivery by air mail takes about 1 week. We will also throw in a copy of the latest DGS catalogue

of PD and commercial software.

Dean Garraghty.
25 September 1993.

I have the following Antic Magazines + disk (all Mint) available:

Vol 4 No 3 (July 85) (disk contains Fontmaker (SG-10 fix), Cryptoquotes
(code breaking help) and the following games:
Slide, Guess That Song, Darkstar, Overflow,
Star Venture, and Miniature Golf)

Vol 4 No 6 (Oct 85) (disk contains Banjo Picker (800 as banjo), Yoga
Breathing (meditating), Graph 3D (3D visuals),
Math Wizard (update), Fine Scrolling World-
Pt 2 (assembly language tutorial), Gem Color
Cascade (converting program to ST), and games
Alien Asylum and Lemonade)

Vol 4 No 7 (Nov 85) (disk contains Morse Code Receiver (convert to ascii),
130XE Memory Management (use the 130's xtra 64K),
Rapid Graphics Converter (universal pic file
converter), Fast Moves (assembly lang. tutorial),
ST Sound (hearing AY-3-8910 chip), and the game
Vampire Rats)

Vol 4 No 8 (Dec 85) (disk contains Diskio Plus (utility), Build your own
EPROM Burner (assembly lang), BBS Crashbuster
(communications prog), Basic to Micro Illustrator
(viewer), several computereyes images in micro
illustrator format, ST Logo Exploration and the
game Box-In (biffdrop classic)

$4 apiece plus $1 per order to cover shipping (continental US).

3698. PBI usage with HD and serial IO

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-25 21:15:56 UTC
From: hwl0978@gemini.tntech.edu
Message-ID: <282cec$s9b@sol.ctr.columbia.edu>
Source record: 104760

One thing that I have wondered about that I have not gotten a decent answer to yet is if it is possible to do disk i/o through the PBI, such as a hard drive, and simultaneously do modem i/o through either the pbi or the serial port? I know that the 8-bit's were set up so that you could not use a modem and drive at the same time due to the fact that the modem completely ties up the serial port. It seems, though, that if the serial port is not needed by the disk drive, then it would be possible to access it through the PBI. Also, it would seem reasonable that if the modem is hooked up through the PBI, then serial disk access could take place. This would probably require rewrites of the handlers involved, but it would open doors to Z-Modem and other streaming protocols. Is it possible?

: Not to nitpi<k, but I believe the PBI DOES exist on the 1200xl, but not
: as a port... I think it's used by Bob Woolley's "Internal IDE HD" ha<k.

Where do you find this stuff? I've been looking on the atari.archive
and on GEnie, and I can't find stuff like how to upgrade a 65XE to 128K
or how to upgrade a 600XL to 64K, and I know I used to see that stuff
around, but no more. I'd love to find new things like an IDE HD hack.

: Do 65xe's have PBIs? Why arent they listed on the bla<k Box
: info in @SS's @atalog? THey list 800xl, 130xe, and even 600xl
: (upgraded, of @ourse!)

The 65XE just has a cartridge port on the back. As you might say, it
may exist on the 65XE, but not as a port. :-)

Oh, and the 65XE would have the EC connector, like the 130XE, not a PBI.
Pick, pick. :-)

>In article 6312@netsys.com, zds@netsys.com (Zoller Data Systems) writes:
>You didn't explicitly mention it, but the BB also gives you a standard RS-232

You failed to mention that the RS232 port on the Black Box is capable of
19,200 baud, the only interface that lets you do that SAFELY.

>You can set a partition on the hard drive to be your boot drive, yes. The
>documentation for BB states that they have not encountered a SCSI drive
>which wouldn't work with the BB. As to how they are accessed - I'm not sure
>what you mean by that question.

There is one drive mechanism that acts a bit funny with the Black Box:
The Miniscribe 8425S. This is due to a screwy design on the drive's
circuit board.

>I should mention I am in no way affiliated with CSS, other than being an
>extremely satisfied customer.

And I am a former employee of CSS. Go figure!

3702. Classic Atari Cartridge List, v. 3.0

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-26 14:20:04 UTC
From: chase@electron.rutgers.edu
Message-ID: <Sep.26.10.20.03.1993.26686@electron.rutgers.edu>
Source record: 104764

Due to some renewed interest in this old list, and the fact that the most recently posted version was a little out of date, I decided it was time to post a new version. Essentially the list has been refined in numerous small ways. Some highly doubtful entries have been removed, some new years have been added, and any errors pointed out to me by the eagle eyed net readers have been corrected. Oh, and the list of contributors has been brought up to date. If I forgot anyone, sorry. As always, any additions, corrections and/or comments are always welcome in my electronic mail box (chase@physics.rutgers.edu).

3703. Screen Flashing (was: JVIEW, and why APAC works)

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-26 18:28:24 UTC
From: A644690C@vax.edinboro.edu
Message-ID: <01H3EOAI1ZP68WVYXP@vax.edinboro.edu>
Source record: 104765

> BTW: have people experienced flashing screens while decoding GIFs (in
> APACVIEW) from RAMdisk? Do their RAMdisks allow Antic banking? Is there
> a good way to detect/avoid this anomaly?
>
> --
> Jeff Potter

This problem is rather pronounced in RAMbo upgraded machines. Since RAMbo does not do seperate CPU/Antic banking, the screen sometimes flickers when a program accesses PORTB in a strange way (ie. Ramdisks, etc.). TurboBASIC XL does this when loading. APACview flickered when loading images (especially when decoding GIFs).

I just wanted to thank all the people that posted in response to my questions about PaperClip. Now I just wish I could find a (original) copy.....

What I may end up doing is just using AW+ or TextPro to write the bulk of my text and then just take the text file to our campus computer center and use WordPerfect for the formatting and printing.

OHHHH! THAT'S how it's done. I have a disk with some Pryzm pi<tures
(the Es<alPaint demo) on it and they all loaded way fast on either of my
sto<k 1050's!

Now I know WHY....

My question be<omes HOW? What does it do to make
even sto<k drives read the disks faster?

Source record: 104768

Hi! I need to know the name of this demo. Like ultimatly to know if it's available on the archive. But I don't know it's name.

It starts out with a song and a brownish background with piano hammer(s) that follow along with the song. It basically has different scenes with different songs. The second is of a rain drop. (I think it was the second). It has one with what a friend of mine said used a megshift 5th voice while it had a player piano on the screen. I also rememre several klaidascope effects. Can anyone help me out?

There was also a game in which you flew around in Santa's sleigh and delievered presents. Thanks.

I

3707. 130XE Busted Keyboard...solution....

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-27 09:01:49 UTC
From: gmchugh@bfsec.bt.co.uk
Message-ID: <CE0932.198@bfsec.bt.co.uk>
Source record: 104769

A week or so ago there was a query about the 130XE keyboard problem where the function keys stop working. Here is the solution as printed in an old copy of Atari User here in the UK.

Open the case and remove the keyboard (carefully) and the aluminium shielding. Find the resistor numbered R95 (should be where the Shift and ? keys would be located.
Desolder and remove this resistor and replace it with a 1k (0.25W) resistor.
This should cure the problem, but if not, disassemble the keyboard and clean the membrane with isopropyl alcohol or something similar.

If you aren't happy with the idea of desoldering from your motherboard, get someone else to do it.....I will not be responsible for anyone killing their 130XE by using this information. It is several years since I did this myself, but it did make a noticeable difference to the keyboard.

A while back I posted an article briefing mentioned that it would be nice
to have MY-DOS on a cartridge to "instantly" boot from.

This would be nice but there is a fair reprogramming job along with
it.. for example I know of one place where it's self modifying; there
may be more. Also if someone were to go to this effort presumably
he'd want to put more than just mydos in... perhaps a bunch of the
standard utilities too, then you'd need a loader. Also presumably
you'd want to use the RAM under the cartridge, so you'd need mapping
hardware.. also you'd probably want to put some of the DOS up there
with DUP to free up RAM.. it's getting to be quite a job. Not that
it's not possible, just a lot of work. -Stan

3710. Re: Ultraspeed

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-27 11:07:50 UTC
From: ipoorten@cs.vu.nl
Message-ID: <CE0Ex3.G6p@cs.vu.nl>

My test worked, so here is some more...

PhBill@Cyberdan.SF.CA.US writes :

> OHHHH! THAT'S how it's done. I have a disk with some Pryzm pi<tures
> (the Es<alPaint demo) on it and they all loaded way fast on either of my
> sto<k 1050's!
>
> Now I know WHY....
>
> My question be<omes HOW? What does it do to make
> even sto<k drives read the disks faster?

This, again, is due to a modified sector skew. (The order in which the sectors are laid down on a track.) On a standard unmodified 1050 the sectors are not placed immediately after eachother (1,2,3...) like said before, but they are interleaved. This means that there is a distance between sector 1 and 2, filled up with other sectors. The format of a standard 1050 is as follows :

Single Density (Interleave factor 9)
1,3,5,7,9,11,13,15,17,2,4,6,8,10,12,14,16,18

Enhanced Density (Interleave factor 13)
1,3,5,7,9,11,13,15,17,19,21,23,25,2,4,6,8,10,12,14,16,18,20,22,24,26

So, after the drive read sector 1, it has halve a cycle time to send it to the computer. Then it can read sector 2 and so on... In practice, it turns out that the drive is already finished when the drive-head is positioned above sector 23 or 25. Now if you format the disk in such a way that sector 2 is on that place, the delay between reading two sectors is shorter. This means that you simply decrease the interleave by one, resulting in the following sequences...

Interleave factor 12 :
1,14,12,25,10,23,8,21,6,19,4,17,2,15,13,26,11,24,9,22,7,20,5,18,3,16
Interleave factor 11 :
1,20,13,6,25,18,11,4,23,16,9,2,21,14,7,26,19,12,5,24,17,10,3,22,15,8

As you see, there are less sectors between sector 1 and 2.

Now you probably want to know how you can achieve the higher speed without having to format your disks at a friend's modified drive. Well, here are two options :

i) It is also possible to read faster with the standard sector skew. You just read the sectors of a track in a different sequence. Not 1,2,3,... but, for interleave factor 11, you read :

Fast Read sequence for virgin 1050 :
1,23,20,15,12,7,4,26,21,18,13,10,5,2,24,19,16,11,8,3,25,22,17,14,9,6

I used something similair to this in my Miracle demo. (Well, I read the whole disk backwards. This does not result into a fixed interleave factor, but it's slightly faster and very simple to implement.)

ii) You could also read out the 1050 drive's ROM, replace the sector skew lists by faster ones and burn a new EPROM. Now, every disk you'll format will read faster on a standard 1050.

At last, I would also say some more about those baudrates. The 19200 baud of the 1050 does not mean that the transmission rate is 1920 bytes/second. It's much lower. A few months ago I did some timing and I found a rate of about 1100 bytes/second. With the fast-read sequence it slightly increased, and even loading from a simulated drive gave me no more than 1500 bytes/second.

The early 65XE's only had a cartridge port. Some 65XE's manufactured
toward the end had an ECI connector. An addendum sheet was included
in the manual mentioning the additional connection.

Roger Cole

P.S. Unfortunately, my 65XE is an earlier model.

What is an ECI or PBI? What do they stand for and how can I tell if I
have them or not? Thanks.

>have them or not? Thanks.

The PBI is the Parallel Bus Interface, which is found on the back of the
600XL and 800XL.

The ECI is the Enhanced Cartridge Interface, which is found on the back of
the 130XE and is software, but not physically, compatible with the PBI.

Well, the Demo was "The Awesome #1 Demo" released by a PD place. The demo was from Germany. And yeah, it's pretty neat. About 80k I think, diskcomm'd.

The game.. I remember the file name: "Deliver". It was pretty weird/neat.

Didn't Broderbund also sell a version of Bank Street Writer for the Atari
8bit? I never actually saw a working version, but I saw it advertized in
magazines and in their catalog. I suppose it would be even harder to find
a copy of than PaperClip.

3721. Atari 2600 &7800 items for sale

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-27 19:43:30 UTC
From: cohen@GOMEZ.phys.virginia.edu
Message-ID: <009732D5.83B1CEC0@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 104786
Cross-posted to: alt.games.video.classic,rec.games.video.classic,rec.games.video.marketplace,comp.sys.atari.8bit

Here is a list of Atari 2600 and 7800 items that I have for sale.
Everything is working (tested prior to posting).

I would like to sell to best (reasonable) offer withing a few days.
You can make offers on any nmber of items you are interested in (no need
to buy everything).

Please e-mail to address COHEN@GOMEZ.PHYS.VIRGINIA.EDU ot call (in case you
have no e-mail account) (804) 293-8973 (prefer e-mail, please).

Thanks!
****

Atari 2600 system and items for sale:

Atari 2600 complete unit- original style:
in excellent condition, with all cables, TV/GAME switch box, and
(if you need one) a 300 ohm-->75 ohm adapter (allows hooking to the cable-
ready connector (75 ohm) on newer TV's that do not have the 300 ohm antena
connectors found in older TV sets), and a 75 ohm-->300 ohm adapter (allows
a direct connection of cable to the "TV in" port on the switch box, as nowadays
vitrually nobody uses the 300 ohm antena cables that the switch box is built
for). (The above adapters can be readily purchased from TV shops and from
Radio Shack and electronics suppliers, I mention them just to let you know
that in case you need them, I can supply them...)

Atari 2600 unit- jr. style-
This is the newer model, which is MUCH smaller, and looks similar to the
7800 design. This is also a complete unit with all parts.

VID-TARI:
A black hard plastic protective hood that goes on top of the Atari 2600, with
a place to put the cartridges and manuals on the top of it; it also allows
joysticks and power supply cable to be connected, so the whole system can be
conveniently operated with it

Atari joysticks

Higher quality game joysticks (various types).

Atari paddles

Official Atari Log Book (like new)

A series of Atari catalogs from different dates.

A storage box for 24 cartridges (Atari 2600/5200/7800) or cassettes or even 8-track casettes if the need arises. Wooden base, smoked clear hard-plastic top, blue velvet-like inside.

CARTRIDGES-

GunSlinger/Target Shoot
Pele's Soccer
Joust
Raiders of the Lost Arc (Lucasfilm/Atari)
Space Jokey (Vidtec)
Strategy X (Konamy)
Chase
Jr. Pac Man
M.A.D. (US Games)
Name This Game (US Games)
Pac-Man
Berzerk
Boxing (Activision)
Home Run
Video Pinball
Astroblast
Outlaw
Star Wars- The Empire Strikes Back (Lucasfilm/Parker Brothers)
Super Challenge Baseball
Grand Prix
RealSports Volleyball
Donkey Kong
Fishing derby
Yar's Revenge
Breakout
Indy 500
Astroids
Activision Freeway
Skiing
Target Fun 27 TeleGames
Activision Kaboom!
Activision Kung-Fu Master
20th Century Fox Revenge of the Beefsteak Tomatoes
20th Century Fox M*A*S*H
Laser Blast (Activision)
Star Master (Activision
Apollo Final Approach
BurgerTime (Data East)
Astroblast (Mattel)
Space Attack (Mattel)
Football
Night Driver
Championship Soccer
SwordQuest-EarthWorld
Basketball
Midnight Magic (Borderbund/atari)

Video Olympics
Space Invaders
Adventures of Tron (Disney)
Circus Atari
Air-Sea Battle
Defender
Combat
Fast Food (Telesysy)

Book for sale-
Hirschfeld- How to Master the Video Games (30 most popular games, includes "Hottest Tips on Pac-Man")

Atari 7800 ProSystem and items for sale-

I have Atari 7800 main unit with one original Atari 7800 joystick, but I do not have the power supply for this unit (takes 9V DC @ 1 Amp.). It works well. (This might be useful for somebody who wants to replace a broken unit, or owners of 7800 systems who want a backup main unit/joystick, or for those who are willing to get the power supply cable on their own.

Atari 7800 cartridges-
Pole Position II
Super Huey
Xevious
Touchdown Football.

Also have the Atari 7800 color poster.

I also have a large number of Atari 2600 items (joysticks, many cartridges) that are fully compatible with the Atari 7800 ProSystem and run perfectly on it (see list above).
****

Please e-mail to address COHEN@GOMEZ.PHYS.VIRGINIA.EDU ot call (in case you have no e-mail account) (804) 293-8973 (prefer e-mail, please).

Thanks!

Source record: 104783

To add to Mike's explanation of Ultra Speed....

As I recall, the scew is only part of it. If it was just the scew, then you could ultra speed format your disks and use them in a plain 1050. As I recall, they read a track of data into memory in the drive, then the sector requests from the computer are pulled out of RAM on the drive (read ahead caching). Doing it this way allowed them to use a better scew on the disketts because the overhead of communicating with the Atari computer was removed.

This is all from memory, and I'd have to look, but I believe this was explained in the documentation that used to come with the US Doubler (guess I'm a proud owner....).

Hope this finishes off the explanation...

Sure, happens all the time. The way I get rid of the flashing is to turn the
screen before decoding. ;^)

BTW: Why didn't you ask us on GEnie? I could have told you the same thing
there too. =)

CC65 as cross-compiler

Recently I have downloaded the CC65 C-compiler from the atari.archive.umich.
edu archive. After installing it on my 800XL, the compile/assemble/link
process turned out to be very slow. I remembered reading
something about CC65 as a cross-compiler. Sadly, I can't get it to work
properly. I have already made several changes to the 'makefile' but it still
gives a lot of warnings. :-(

Does anyone know how to create this cross-compiler or is there anyone out
who has already managed to work with CC65 on a UNIX machine ???

Please response on this newsgroup or mail to :

ipoorten@cs.vu.nl

Thanx,
- The Gatekeeper -

> large obsticles...
> Ricky
> (gumby@ace.com)
About 10 years ago I designed an eprom programmer using three
joystick ports on the atari 400. The problem I had was generating
the time critical programming pulse. I used a software loop to generate
this pulse and this method was very unreliable. I haven't dealt with
eproms since then so the programming pulse may be a non-issue. Anyway
I thought I would pass this information on in case you or anyone else
was trying a similar thing.

~
ANOTHER NEW PRODUCT FROM D.G.S.
==========

Well, we don't waste any time! When there are new products around we find them and publish them! Last time we linked with Rambit software, now we link with Richard Gore to bring you: DEMO MAKER.

Demo Maker is a piece of software to allow you to easily make flashy looking screens with multi-coloured scrolling text. Demo Maker contains everything required to produce the background picture and the text itself.

Basically, you start off with a blank disk, and then you copy a few things on to this disk from the Demo Maker master disk. Then on goes your picture file and text for scrolling along with the actual software to produce the demo. The text is in Antic mode 4 or 5, and so is huge.

In order for you to draw the background picture, a graphics program called Edit 7 has been included on the disk. This allows you to draw a picture in mode 7. Edit 7 has all the usual facilities that you would expect from a drawing program including line, circle, border, spray can, text, and so on. You use Edit 7 to produce the background picture for your demo screen.

You also get an editor where you type in your text for the scroll line. This program will also produce the special files used in your demo screen.

Included on the Demo Maker disk is a ready done demo for you to look at. You also get 2 music files to merge into your final demo screen to liven it up a little! You also get commented source code for all machine code routines used. Several font files are also included for Edit 7.

Demo Maker requires no specialist knowledge. You will just need a very basic knowledge of Basic and DOS 2.5.

Demo Maker is written in Turbo Basic. A copy of this is included on the disk. This means that Demo Maker will only run on XL/XE machines with 64K minimum. It comes on a DS/SD disk with a 12 page printed manual explaining everything you need to know in order to create your own demo screen.

Demo Maker is available direct from DGS in the UK. The price to the U.S is $10 including Air Mail shipping. U.K price is 3.99 (pounds). Price to EEC countries: 5pounds. U.S users pay in cash in US$. EEC pay in cash in UK pounds, or by IMO in UK pounds.

Get Demo Maker direct from:

Curtis Wilbar (curtis@darkwing.East.Sun.COM) wrote:
: To add to Mike's explanation of Ultra Speed....

: As I recall, the scew is only part of it. If it was just the scew, then you could

Right. But don't confuse two concepts...
Sector Interleave is the pattern of sector follow within a track, which makes a
HUGE different in performance. 1:1 interleave is generally considered optimal,
which means all sectors of a track are read in one pass.
Sector skew is similar, but refers to the sector alignment between tracks.
A 1:1 interleave arrangement would be like this with no skew:

```
-------------------------------------------------------------------------
1| 2| 3| 4| 5| 6| 7| 8| 9|10|11|12|13|14|15|16|17
-------------------------------------------------------------------------
1| 2| 3| 4| 5| 6| 7| 8| 9|10|11|12|13|14|15|16|17
-------------------------------------------------------------------------
```

As you can see, after the head passes sector 17, track-to-track transfer
time would put the fastest drives past sector 1 of the next track, therefore
sequential reads would have to wait an extra revolution before reading where thedata
continues. At 275-290 rpm this may not seem bad but it adds up.
A much better skew for a fast 1:1 interleave drive would be 3...

```
------------------------------------------------------------------------- 1| 2| 3| 4|
5| 6| 7| 8| 9|10|11|12|13|14|15|16|17
...|13|14|15|16|17| 1| 2| 3| 4| 5| 6|...
-------------------------------------------------------------------------
```

(Apologies for the rendition... It's devilish hard to draw circular tracks
on a linear medium :)
With this scheme, the head-positioner will change tracks just in time to
read sector 1 of the next track on a sequencial read operation, thereby
speeding the drive up a little bit (though not nearly as much as interleave).

I built CC65 as a cross-compiler on a Sun SPARCstation 1 about four years ago. I didn't do much work with it, but I did enough to get it to work before we got rid of the SPARCstation. What kinds of problems are you experiencing?

One thing I noticed was that CC65 assumes a case-INsensitive environment such that it failed to operate properly "as shipped" when built on the case-SENSITIVE Sun system. I had to do some finagling to get the assembler to accept the output file of the compiler as I recall.

Afraid not. Composite monitors do use NTSC or PAL, depending on the
country. NTSC and PAL are different ways of encoding R,G,B, luminance and
sync into a single composite video signal. You might be able to get a
black-and-white image, and you'd have to adjust the vertical hold.

Source record: 104706

Well, let's tell what I have changed up to now and what problems still occur.

I have replaced the #asm .... #endasm sequences by /* #asm .... #endasm */ because both cc and gcc didn't excepted it.

Now I don't get errors but still a whole bunch of the same warnings. (illegal combination of pointer and integer, op =).

The changes in makefile are mostly changed back again. Most of them where due to my lack of knowledge about the system. e.q. it couldn't find gcrt0.o because $GNULIB wasn't defined. Now it is. But there is still one thing. The -lgnu switch for the linker. I don't know where to find the gnu-library, so I changed it into # -lgnu.

After this, if I type make, cc65.ttp and some other ttp files are created, but if I run it, it says Memory fault - core dumped.

Kevin Chase mailed me that he sucessfully set up a cc65 cross compiler. He told me that 32bit architectures want ints aligned on 4 byte boundaries. Probably that's what is wrong. But how do I fix it ?

Don't forget also that Europe and the states work on different mains supply frequencies.
This will cause problems with the sync's, as the frame rate will be
different. Can get adaptors though, I believe.

The ATR8000 plugs into a standard SIO port. From there, you can install virtually any size/density drive by attaching it via a standard 34pin ribbon cable on the rear of the unit.

You also have ports for the Rs232 (modem) and a printer.

I just gave a friend here in town my ATR (after his hard disk and controller died).

They are very handy for high density uses.

Somewhat slow, but at least functional!

Source record: 104710

Sorry to bring up old business here. Things at AC have kept my nose to the grindstone, I'm just now catching up on old Digests.

This is an update for Mike Clemmons & others who may have wondered how I fared in my attempt to bring TurboFile back to the market. (Note: I was only interested in TurboFile, not TurboBase. I believe TurboBase incorporated TurboFile, it was a much more comprehensive business program.)

I'm sorry to say the negotiations have been broken off. I found the man just too frustrating to deal with. I sent him two well-drawn contracts. The first one was instantly trashed because the man failed to inform me he was using an assumed name (!). After several hours of long-distance phone calls to Florida, plus all the time I spent drawing up contracts which MicroMiser turned into chopped liver, I gave up. I put a good 20 hours into the thing, the initiative of communication was all on my side, & it was sucking too much time away from my responsibilities to the magazine.

To his credit, MicroMiser did actually sign my 2nd contract, but not before scribbling all over it (5 pages worth) & adding a page of additional clauses we didn't discuss on the phone & which I felt were absurd. He pretty much did the same thing to my first contract, the frustration was too much.

MicroMiser also claimed that, of their 3 products (TurboFile, TurboWord, & TurboBase) the TurboFile code was the "cleanest" of the lot. Baloney. It's spaghetti. And not commented. And the program has bugs which I've discovered the hard way.

Just keeping AC alive is sucking every resource I can muster, I have nothing left over to give. It will have to devolve upon others to rescue products for our market. I extended myself beyond my limits & learned a hard lesson. I won't try anything like this again.

Most regrettable.

3753. MYDOS DISKS TO BE MAILED!

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-29 18:39:07 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <wZiNac4w165w@cyberden.sf.ca.us>
Source record: 104715

Ok... How's this... I've had at least three people request copies of
MyDOS for use on their "drived but diskless" Atari systems. (ie they
have a drive, but nothing to boot it with!)

I'm willing to send out one disk which will include MyDOS, it's DOCs, and
some other stuff and their DOCs (what exactly will end up being what
everyone really wants right off... it's all PD and easily gotten).

What I'll do is this:

I'll send the disk to Mr.X
Mr.X boots up the disk and makes a copy for himself.
Mr.X will send the disk to Mr.Y
Mr.Y boots up the disk and makes a copy for himself.
Mr.Y will send the disk to Mr.Z
Mr.Z boots up the disk and makes a copy for himself.
Mr.Z, in fairness, will mail the disk back to me.. so he spends the same
amount as the rest of us (postage + 1 disk), instead of just the
price of one disk.

Also, this will enable me to send it out on another journey.. The
problems are:

the more journeys, the more postage >I< pay :)

the fact that the post office isn't always kind to Atari disks ;)

But other than that, I think this may work out.

So... to ALL THOSE WHO HAVE MAILED ME BEFORE AND ALL THOSE WHO
DON'T HAVE A BOOT DISK FOR THEIR SYSTEM (or access to a
place with MyDOS and good utilities) E-MAIL ME NOW WITH
YOUR POSTAL ADDRESS!

:)

I'll then perhaps mail it out alphabetically..? Or first come, first
served (hopefully I can remember who mailed me first about this in the
FIRST place! ;))....?

Also, please tell me what all you'd like to see on the disk.

The base of it will be: DOS.SYS, DUP.SYS (MyDOS boot files),
VTOCFIX.COM (and any other utils that came with MyDOS), MYDOS.DOC,
TECH.DOC (the MyDOS documents. My TECH.DOC is killed though.. sorry.),
and possibly things like TurboBASIC XL, Bob Puff's Super ARC and unARC
2.4 programs, DiksCommunicator 3.2, etc.....

WRITE ME! :)

```
The Rom Magazine Collector's Series
Canada's first Atari only Magazine (1983-1985)

- the series includes:

* numerous technical articles about Atari 8-bit systems
* reviews of many original 8-bit products
* interviews with may early 8-bit Software developers

PRICES: (all prices in U.S. dollars)
- the complete set of 10 - $65 (US)

Issue 1 $17.50 (US) Issue 6 $5.75
2 8.00 7 6.50
3 8.00 8 7.00
4 5.50 9 9.25
5 5.50 10 5.50

- plus $3.00 mailing and handling
- money order or certified cheque please

Send To: ROM
11469 256st RR#1
Maple Ridge, BC, Canada
V2X 7E6

or E-Mail any questions to a9355@Mindlink.bc.ca

3757. MAJOR PROBLEMS

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-30 10:19:26 UTC
From: djg0@aber.ac.uk
Message-ID: <9309301019.AA07133@deca>
Source record: 104719

It looks like I may not have e-mail anymore after today. The site I use is banning all accounts that are not registered - like mine! I can't do anything about this, other than to try again and
get an account on Freenet - it failed last time -- I didn't get the thing to sign.

Sorry about all this.

Dean Garraghty.

3758. Atari 800 package wanted

Newsgroup: comp.sys.atari.8bit

From: rr@sherwood.digital.ufl.edu
Message-ID: <28el60$i8e@bigguy.eng.ufl.edu>
Source record: 104720

I'm interested in an Atari 800 package, with a 5.25" floppy drive,
and as many games in disk or cartridge for that is available.
If you have just one part of this package, please go ahead and
mail me your info. Anyone interested in parting with this stuff
please email me at rr@eng.ufl.edu. Thanks!

-Robbie

3760. E-mail addresses wanted

Newsgroup: comp.sys.atari.8bit
Date: 1993-09-30 15:00:29 UTC
From: aa700@cleveland.Freenet.Edu
Message-ID: <28esad$887@usenet.INS.CWRU.Edu>
Source record: 104722
Cross-posted to: comp.sys.atari.8bit,rec.games.video.classic,rec.games.video.misc

I'm looking for any e-mail addresses of companies that have formerly
produced software for the 8-bit Atari computers. Examples include:

Atari Corp.
Electronic Arts
Broderbund
Sierra On-Line
Accolade

Hopefully there are many more possibilities than these. E-mail me!

Message-ID: <28euqj$j3f@dr-pepper.East.Sun.COM>
Source record: 104723

In regards to Daniel's addition to my follup posting...

Yes, I had reversed the two words in my head... I was intending interleav,
and said scew. Both each have their effect.

I know that 1:1 is optimal, but not possible with standard drives. I do not know
what the optimal value is for Ultra-speed drives, but I'm sure they use a different
interleave and scew to obtain their performance, and I do believe they use read
ahead and a RAM cache on the drive.

Thanks Dan,

To quote from the new book by Michael Fraase "If the person you are trying
to locate has ever posted a message to any of the USENET newsgroups, you
may be able to locate him or her by using a specialized mail server at the

MIT. The MIT server constantly monitors incoming USENET postings and
extracts each poster's name and e-mail address.

To use the service:
1. Send an e-mail message consisting ONLY of the single line:

send usenet-addresses/NAME
where NAME is the name of the person you are trying to locate.

2. Address the e-mail message to mail-server@pit-manager.mit.edu

3. Send the message. You will soon receive a reply listing past USENET
posting addresses

Hope this is some help, and that knowledge of this service will make
dirtbags think twice before rip-offs.

Mail these days is handled via MX records in the name server.
If the companies have any form of internet address (rather than x.uucp, or
a bang address), then they will be on file with a NIC.
For a site on the US Internet network (note: not the same as The Internet)
contact the Internet Network Information Center.

% telnet internic.net

I went into wais, and with 0 effort got the information at the end of this
posting.

If you are not on the US internet, the easiest way to find the address
for your NIC (or somewhere to start your search) is to look up the Start of
Authority record for the domain you think they are in.

If you wanted the email address for a company in the United Kingdom, you
might try.

```
% nslookup
> set type=soa
> uk.
Non-authoritative answer:
uk origin = ns1.cs.ucl.ac.uk
mail addr = liaison.ess.cs.ucl.ac.uk
serial=930929, refresh=14400, retry=1800, expire=3600000, min=360000
```

If there is no anonymous telney service, then sending mail to
'liaison@ess.cs.ucl.ac.uk' in this case might get you what you want.

Right. I believe one of the reasons for replacing the drive controller on
the 810 and 1050 is that they can't meet the timing requirements for reading
at 1:1 interleave and short-skew timing... Although, all of the high-density
drives (1.2Mb, 1.44Mb and 2.88Mb) only read/write at 1:1.

Yeah, I think the combination of improvements really 'feed' one another...
1:1 int. capability makes caching more efficient, cacheing makes sector access
more efficient, etc. I just wonder what the difference is between the
US DOubler Drives and the Happy 1050 drives (I have a Happy 1050)?

Ivo P. van Poorten (ipoorten@cs.vu.nl) writes:

>Well, let's tell what I have changed up to now and what problems still
>occur.

I hope this wasn't directed specifically to ME just because I responded to your previous posting! It's been YEARS since I fooled with building CC65 as a cross-compiler, and it took MONTHS even then, with John Dunning holding my hand all the way. I knew/know just enough Unix to get into trouble, likewise just enough C -- and NO GNU whatsoever.

>I have replaced the #asm .... #endasm sequences by /* #asm .... #endasm */
>because both cc and gcc didn't excepted it.

Offhand, I'd say the "#asm ... #endasm" sequences were probably there for a reason, and that commenting them out might in itself be responsible for misbehavior in the end product. But I don't know that for sure. As it's been such a long time, tell me: what kind of ML appears BETWEEN "#asm" and "#endasm"? 6502? Or whatever the ST uses? You DO realize that CC65 is intended to generate 6502 code as output, right?

>Now I don't get errors but still a whole bunch of the same warnings.
>(illegal combination of pointer and integer, op =).

I vaguely recall some of these. If they're just WARNings, you can probably ignore them. Use'ta be in the early days of C, there was little or no type-checking, and you could blithely assign any "type" of pointer to any "type" of variable. Today's compilers allow that too but flag it as a warning that "the types don't match." Personally I find that a little annoying, but then, I come from a long stretch of assembly programming and don't like "data typing" to begin with. :-)

>The changes in makefile are mostly changed back again. Most of them where
>due to my lack of knowledge about the system. e.q. it couldn't find
>gcrt0.o because $GNULIB wasn't defined. Now it is. But there is still one
>thing. The -lgnu switch for the linker. I don't know where to find the
>gnu-library, so I changed it into # -lgnu.

I have no idea. Try reading the man pages for your compiler. Usually the "-lsomename" compiler switch causes the compiler to strip off the "-l" portion, tack an extension such as ".a" onto the "somename" portion, and look for "somename.a" in a predefined system directory -- maybe /lib or /usr/lib. I'd use the Unix "find" command to search for "-name *.a". Don't forget "-print" on the find command.

>After this, if I type make, cc65.ttp and some other ttp files are
>created, but if I run it, it says Memory fault - core dumped.

Sounds like you're on the right track, but without that Gnu lib I'd say
your system either doesn't have Gnu installed on it, or that your system's
Gnu C configuration doesn't match what CC65's makefile expects.

>Kevin Chase mailed me that he sucessfully set up a cc65 cross compiler.
>He told me that 32bit architectures want ints aligned on 4 byte
>boundaries. Probably that's what is wrong. But how do I fix it ?

That ought to happen automatically, I would think. If not, perhaps your
C compiler supports #pragmas or language extensions to force data alignment.
Gotta find manuals somewhere.

Source record: 104730

Well, this is my second attempt at this post - the first disappeared without a trace!

If any of this is in the FAQ, then could someone please post it!

1) Does anyone still sell hard disks/interfaces for the 8 bits, if so who, and how much?

2) Is there a combined hardware/software solution to reading/writing IBM format disks on the 8 bit (5.25" and 3.5")

3) What other archives are there than atari.archive.umich.edu ?

4) Has anyone built a composite video -> rgb convertor?

5) Has anyone added a real time clock to their 8 bit?

Thanx,

Mark.

3770. 8-bit Atari Frequently Asked Questions

Newsgroup: comp.sys.atari.8bit
Date: 1993-10-01 16:18:52 UTC
From: MCURRENT@carleton.edu
Message-ID: <01H3LGJM17EQ8Y58EA@carleton.edu>
Source record: 104731

```
Atari Archive: 8bit/faq.txt

Welcome to the comp.sys.atari.8bit/Info-Atari8 Digest discussion group!

The 8-bit Atari

Frequently Asked Questions List

Revised 31-Aug-93

Additions/comments/corrections having to do with this FAQ List are
welcomed by its creator and maintainer, Michael Current:
Internet: mcurrent@carleton.edu
UUCP: ...!umn-cs!ccnfld!mcurrent
Cleveland Free-Net: aa700

The 8-bit Atari FAQ List is posted on or about the first of the month to
the comp.sys.atari.8bit/Info-Atari8 Digest discussion group.

What is this FAQ List for?
The 8-bit Atari FAQ List was created to provide answers to many commonly
asked questions found in the comp.sys.atari.8bit/Info-Atari8 Digest discussion
group. At this time the FAQ List is heavily geared toward describing the
various resources for the 8-bit Atari user available, with relatively little
information on the Atari itself.
This is not an "official" FAQ List in that it is not cross-posted to the
moderated newsgroups news.answers and comp.answers. (There's no particular
reason for this, I just haven't taken the time to figure out the process yet.)
Hence no automatic archiving of this FAQ List occurs, though there's usually
a fairly recent copy on the Atari Archive (see below) as the file
8bit/faq.txt.

What is comp.sys.atari.8bit?
comp.sys.atari.8bit is the unmoderated newsgroup serving as the Usenet
side of this discussion group. All postings to comp.sys.atari.8bit
automatically appear in the Internet's Info-Atari8 Digest.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid on
comp.sys.atari.8bit.

Other Atari-related newsgroups:
comp.sys.atari.advocacy (pros and cons of Atari computers)
comp.sys.atari.st (ST/TT/Falcon)
comp.sys.atari.st.tech (ST/TT/Falcon technical)
comp.sys.palmtops (includes Portfolio)
rec.games.video.arcade (includes products by Atari Games)
rec.games.video.misc (includes Lynx, "Jaguar")
```

rec.games.video.classic (includes 2600, 5200, 7800)

What is the Info-Atari8 Digest?
The Info-Atari8 Digest is the unmoderated mail-list serving as the Internet side of this discussion group. All contributions to the Info-Atari8 Digest automatically appear on Usenet's comp.sys.atari.8bit. The Digest is maintained by John Dunning, jrd@stony-brook.scrc.symbolics.com.

To SUBSCRIBE or UNSUBSCRIBE to the Info-Atari8 Digest, send e-mail to info-atari8-request@naucse.cse.nau.edu.
To CONTRIBUTE to the Info-Atari8 Digest, send your posting to comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on Usenet's comp.sys.atari.8bit.
Note that any posting sent to info-atari8@naucse.cse.nau.edu will NOT be cross-posted to the Usenet side. John Dunning would like this fixed, but needs help; if you are an accomplished UNIX programmer please contact him.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid in the Info-Atari8 Digest.

Other Atari-related mail-lists:
The Info-Atari16 Digest (ST/TT/Falcon). Send e-mail to info-atari16-request@naucse.cse.nau.edu.

What is the Atari Archive?
atari.archive.umich.edu is an Internet site which contains many files for the 8-bit Atari computers. Our 8-bit Atari Archivists are John Dunning, jrd@atari.archive.umich.edu, and Jody Lenn, lenn@atari.archive.umich.edu. The Atari Archive as a whole is maintained by Jeff Weiner, weiner@atari.archive.umich.edu.

How do I DOWNLOAD files from the Atari Archive?
In one of four ways:
1. FTP (Try the one nearest you first)

a) FTP to atari.archive.umich.edu (141.211.165.41) <--United States
User: anonymous
Password: [your e-mail address]
cd atari/8bit

b) FTP to wuarchive.wustl.edu (128.252.135.4) <--United States
User: anonymous
Password: [your e-mail address]
cd mirrors/archive.umich.edu/atari/8bit

c) FTP to src.doc.ic.ac.uk (146.169.2.1) <--Great Britain
User: anonymous
Password: [your e-mail address]
cd computing/systems/atari/umich/8bit

d) FTP to archie.au (139.130.4.6) <--Australia
User: anonymous
Password: [your e-mail address]

```
cd alex/edu/umich/archive/atari/atari/8bit

e) FTP to info2.rus.uni-stuttgart.de (129.69.8.13) <--Germany
User: anonymous
Password: [your e-mail address]
cd /afs/umich.edu/group/itd/archive/atari/8bit

Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

2. BART - Brode's Archive Retrieval Thang - the Archive's e-mail file server
To learn about using BART to access the Archive, send e-mail to:
atari@atari.archive.umich.edu. The subject of the message doesn't matter, but
let the body of your message be:

help
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes),
try including a line of this form:

path [your e-mail address]

BART automatically uuencodes binary files (so they may be mailed over the
Internet) and splits up large files into parts of about 30K or less.

3. Gopher
The Atari Archive can be accessed in Gopher. If your Gopher server
doesn't provide a path to atari.archive.umich.edu, try the command:
gopher gopher.ius.itd.umich.edu

4. AFS
If your system has AFS capability, this is the easiest way to access the
Archive. Just cd /afs/umich.edu/group/itd/archive/atari/8bit

How do I UPLOAD files to the Atari Archive?
In one of three ways:
1. FTP
FTP to atari.archive.umich.edu (141.211.165.41)
User: anonymous
Password: [your e-mail address]
cd atari/8bit/New

(No uploads may be made to the Archive's mirror sites.)

Remember to set file type to BINARY when uploading non-text files
(.arc, .com, .dcm, etc.) by FTP. Also, please upload a short .text file
describing what your upload is, so our 8-Bit Archivists will be sure to place
it in an appropriate permanent directory.

Note that the atari/8bit/New directory is "write-only."

2. E-mail
This is a bit slower, but is still very effective.
Simply uuencode the file, (please split it into parts of 60 K or less)
```

and mail the result to weiner@atari.archive.umich.edu. Please name
the parts in the subject line. This is really helpful as the parts
usually don't arrive in the proper sequence. Also, please include a
message labeled "file transmission," containing a short description of
the file, etc. Shar files are also acceptable, but uuencoded is preferred.
It is especially important to specify that your upload is for the 8-bit
computers, since most of what Jeff receives is for the ST/TT/Falcon.

3. AFS
If your system has AFS capability, this is the easiest way to upload to
the Archive. Just cp the file into
/afs/umich.edu/group/itd/archive/atari/8bit/New

Are there any other 8-bit Atari FTP sites?
Here's another, maintained by Adam Bryant, adb@albert.bu.edu:
FTP to cs.bu.edu (128.197.2.1)
User: anonymous
Password: [your e-mail address]
cd PC/ATARI

Are there any alternatives to BART?
There are two general-purpose FTP mail-servers. These may be used to
retrieve any files available from anonymous FTP sites on the Internet,
including atari.archive.umich.edu.
1) ftpmail@decwrl.dec.com
For information, send a mail message to the above address where the body of
your message says:
help
quit
2) bitftp@pucc.princeton.edu
For information, send a mail message to the above address where the body of
your message says:
help

What is the Cleveland Free-Net Atari SIG?
The Cleveland Free-Net is like a huge public bulletin board system, and it
is the hub system of the NPTN, the National Public Telecomputing Network.
Anyone can access the Free-Net via modem at (216) 368-3888. Those persons
with full Internet access can TELNET (this does not mean FTP) to
freenet-in-{a,b,c}.cwru.edu (129.22.8.38). Applications for accounts
are handled online. Once logged-in, type "go atari" to reach the Atari SIG.
Those who add their names to the Atari SIG user directories are automatically
members of the official Atari user group CAIN - Central Atari Information
Network. Send correspondence and press releases to xx004@po.cwru.edu.

What print magazines support the 8-bit Atari?

Atari Classics (exclusively 8-bit)

What product developers or vendors support the 8-bit Atari?
See the companion frequently posted text file, "All Known World-Wide 8-Bit Atari Vendors and Developers" for complete information. This file is posted to the comp.sys.atari.8bit/Info-Atari8 Digest discussion group on or about the 15th of the month. There's also usually a fairly recent copy available on the Atari Archive as the file 8bit/faq2.txt.

What's this UUEncoding stuff (.uu, .uue files) all about?
UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. On the Atari Archive:

Uudecode 1.2a by John Sangster - very functional. Archive filenames:
8bit/Archivers/uudecode.bas - just ENTER this into Atari BASIC
8bit/Archivers/uudecode.doc - the User Manual

Yet Another UU-coder by ?John Dunning? - both decoding/encoding. Filename:
8bit/Archivers/yau.arc - contains both yau.com and yaue.com.

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use." Filename:
8bit/Utilities/uue.arc - contains uudecode.com, uuencode.com.

Dumas UU-coder by John Dunning - should work w/BART-style split files. Fname:
8bit/Cc65/dumasuu.arc - contains uud.com, uue.com, CC65 sources.

What is an .arc file?
A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The Atari Archive contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended. Filenames:
8bit/Archivers/superarc.arc - both Super Un-Arc and Super Arc
8bit/Archivers/suprarc2.arc - just Super Arc
8bit/Archivers/supunarc.com - an un-arc'd copy of Super Un-Arc
8bit/Archivers/supunarc.uue - uuencoded copy of supunarc.com

Okay, how about a .dcm file?
A .dcm file is a format unique to the 8-bit Atari which is used to convert
entire disk images into files. To work with .dcm files you'll need:

Disk Communicator 3.2 by Bob Puff. Archive Filenames:
8bit/dskcom32.arc
8bit/Archivers/diskcomm.arc

Can I read/write 8-bit Atari disks on an IBM-PC?
There are several programs on the atari.archive of this variety. Note
that most require a DOS and disk drive on the Atari end capable of the SS/DD
180K format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs are:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
8bit/Diskutils/atario21.arc

Mule by Rick Cortese - Reads/Writes SS/ED 128K Atari disks. Very limited.
8bit/Diskutils/mule.arc - includes Atari Mule; Action!, Turbo C sources
8bit/Diskutils/mule.exe - IBM Mule
8bit/Diskutils/mule.txt - descriptive blurb

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks. Filename:
8bit/Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Quite popular.
8bit/Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

What's the best DOS for the Atari?
This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2D is disk-based; SpartaDOS X is cartridge-based and includes many additional features. While it's hard to argue that SpartaDOS X is not the most advanced DOS available, it is a commercial product that is no longer manufactured. MYDOS, on the other hand, is a shareware product that continues to be improved upon.
It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. MYDOS is available at the atari.archive.

What are the best telecommunications programs available for the 8-bit Atari?
Here are some of the more popular PD/shareware terminal programs available on the Atari Archive:

BobTerm by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Archive filename: 8bit/Telecomm/bterm12.arc

Kermit-65 by John Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Archive filenames:
8bit/Telecomm/k65v37.arc - the latest version
8bit/Telecomm/k65doc.arc - the documentation
8bit/Telecomm/k65src.arc - the source code

OmniCom by CDY
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Archive filename: 8bit/Telecomm/omnicom.arc

VT850 by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: none
Autodial: No
Archive filename: 8bit/Telecomm/vt850b1.arc

What hardware has Atari created in the 8-bit computer line?
Computers:
400 (1979) 8-16K, membrane keyboard, 400/800 OS

800 (1979) 8-48K, two cartridge slots, 400/800 OS
1200XL (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL (1983) 16-64K, BASIC, PBI, XL OS
800XL (1983) 64K, BASIC, PBI, XL OS
800XLF (????) ?????, a U.K. variety...
65XE/800XE (1985) same as 800XL minus PBI
130XE (1985) same as 65XE with 128K plus ECI
XE Game System (1987) same as 65XE plus Missle Command, detach. keybd.

Peripherals:
410 Program Recorder (Japan and Hong Kong versions)
810 Disk Drive SS/SD 90K with DOS 1 or DOS 2.0S, MPI&Tandon vers.
820 Printer (40 col.)
822 Thermal Printer (40 col.)
825 Printer (80 col.), req. 850
830 Modem (300 baud acoustic, req. 850, with Telelink I)
835 Modem (300 baud, with Telelink II)
850 Interface Module (4 9-pin serial, 1 15-pin parallel ports,
beige & black metal versions)
1010 Program Recorder (Sanyo and Chelco versions)
1020 Printer/Plotter (print/draw in 4 colors)
1025 Printer (7-pin dot matrix, 80 col.)
1027 Printer (80 col., letter quality)
1029 Printer (7- or 9-pin??? dot matrix)
1030 Modem (300 baud, with 1030 Express!)
1050 Disk Drive (SS/ED 128K with DOS 3 or DOS 2.5)
XC12 Program Recorder
XM301 Modem (300 baud, with XE Term)
XMM801 Printer (80 col.)
XDM121 Printer (80 col., letter quality)
XF551 Disk Drive (DS/DD 360K with DOS XE)
XEP80 Interface Module(80 col. video display and DB25 parallel port)
SX212 Modem (1200 baud, rarely with SX-Express! package)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 2 x SS/DD 180K with DOS 2.0D
1064 64K RAM module for 600XL
1090 XL Expansion System, for PBI, CP/M/MS-DOS/Apple II compatible
XM128 12" green monitor w/ built-in 80-column card
XC1411 composite 14" color monitor
XF521 5.25" floppy drive - 1050 compatible, in XE style
XTM201 non-impact printer
XTC201 non-impact color printer

Where is my nearest 8-bit Atari user group?
Where is my nearest 8-bit Atari BBS?
Lawrence Estep at Atari Classics magazine maintains lists of 8-bit Atari
BBSs and 8-bit Atari user groups, each of which is too long to include here.
Contact him at 71450.1050@compuserve.com.

What are the pinouts for the...?

>for misbehavior in the end product. But I don't know that for sure. As it's
>been such a long time, tell me: what kind of ML appears BETWEEN "#asm" and
>"#endasm"? 6502? Or whatever the ST uses? You DO realize that CC65 is
>intended to generate 6502 code as output, right?

Kill all the #asm stuff. Although there inclusion is nice for those
who want to build C code with embedded asm statements, it just
wrecks a lot of other C compilers. This code should be in separate
files and included at the as stage, not at the cc stage.

>>Now I don't get errors but still a whole bunch of the same warnings.
>>(illegal combination of pointer and integer, op =).

cc65 often treats char * and int as the same beast. These warnings
should not present problems on most computers. Some will be killed
by this, however.

>>The changes in makefile are mostly changed back again. Most of them where
>>due to my lack of knowledge about the system. e.q. it couldn't find
>>gcrt0.o because $GNULIB wasn't defined. Now it is. But there is still one
>>thing. The -lgnu switch for the linker. I don't know where to find the
>>gnu-library, so I changed it into # -lgnu.

Most compilers don't need this. This is an Atari ST specific thing.

>>Kevin Chase mailed me that he sucessfully set up a cc65 cross compiler.
>>He told me that 32bit architectures want ints aligned on 4 byte
>>boundaries. Probably that's what is wrong. But how do I fix it ?

>That ought to happen automatically, I would think. If not, perhaps your
>C compiler supports #pragmas or language extensions to force data alignment.
>Gotta find manuals somewhere.

Not necessarily. One problem with cc65 was that it used
its own malloc() to set up space for various structures. The routines
assumed a 68000 style architecture, with everything aligned on even
boundaries. My Sparcstation crashed big time on this, but was easy to
diagnose. Here is my patch

```
in Gmalloc()
- nbytes = (nbytes + sizeof(int) - 1) & (~(sizeof(int) - 1));
+ nbytes += sizeof(char *) - (nbytes & (sizeof(char *) - 1));
```

```
and in addmac()
- gsptr += (((long) gsptr) & 0x1);
+ gsptr += sizeof(char *) - ((long)gsptr & (sizeof(char *) - 1));
```

3772. A few days grace?

Newsgroup: comp.sys.atari.8bit
Date: 1993-10-01 17:11:19 UTC
From: djg0@aber.ac.uk
Message-ID: <9310011711.AA19788@deca>
Source record: 104732

It looks like I have a few days more of email access - they haven't closed
my account u yet.

I have a quick e question:

I've just got a new Panasonic KX-P1123 printer which I have connected to an
850. BUT, it refuses to print anything when used with AtariWriter (or +). I
can get it working with Textpro, Basic, Daisy 3, DOS, and various graphics
programs but not A/W! Can anyone help?
Is it the 850 that is the bad a part of this set-up?

If you can get email to me by Monday then we should be OK.

Dean Garraghty
djg0@aber.ac.uk

gg> The biggest reason is cost! I can build one myself for around $30,
gg> as opposed to $100 and up...

By the time I figure out how to build a burner, program the software and actually build the thing, the $100 was more than worth it. Still, I've never said you shouldn't do it...what I did say was I'd thought about saying it. Non the less, I do wish you the best of luck, if you can produce your burner for a reasonable cost, you'll likely find a number of people knocking a your door.

Hey... you gave it an ex<ellent try, it sounds like... you took a good
initiative, and if the guy wasnt su<h a dolt (he sounds like it!),
you'd've done something that I havent yet heard happen to the 8bi atari -
bring ba<k an old title from the dead! :)

Soo.. has it been done before?

Anyways... it stinks that you didnt have enough time, but I'm sure
someone (DONT LOOK AT ME! ;)) would have the time to get some software
out of the @losets of sin<e-IBM'd @ompanies and ba<k into produ<tion...

-babble...sorry :)

Hi, I just dug out my old 8-bit Atari from storage and I'm starting to play some old games on it - but since I'm just playing games, I'm wondering how much I can get for the other peices. I have and 850 adaptor, (broken? actually, no power supply) Supra DD drive and also have a 7800 system with various carts (xevious, food fight, etc.).. Please reply by e-mail to me since I don't read this group often - but anyone know how much I could expect for these? My friend has similar hardware he might have for sale too..

Thanks!
Bryan

If you check out the Atari Archive, I'm pretty sure they have a copy
of the OS Technical Manual. Its a sizable piece of text which explains
a great deal on nearly everything you could think of. [Unless you're
already an advanced Atari programmer/guru then its kinda sparse] You
can also check out the Atari 8-bit Sig on Freenet. We have a copy of
this Technical Manual as well as other informative articles. The
address is: hela.ins.cwru.edu [go atari, then 8-bit selection]

Anybody using Bob Puff's EPROM burner should be aware that I have had major reliability problems with chips burned on this device. I was burning my production EPROMs with this, and had many failures in the field that were all attributed to EPROMs losing their programming. His algorithm does not burn the chips hard enough, and it creates weak bits that can revert to 1's somewhere down the road. I had two units that did the same thing, and they were sent back and hand tweaked by Bob after I mentioned the problems I was having. I only know one other person who used it, and he had similar troubles. In fact, one of the software upgrade EPROMs that Bob sent to me had the same failure of weak bits.

I don't know if this is a result of Bob trying to make the burning process as fast as possible, and cutting it too close. At first I was burning my chips at speed 3, but later slowed it down to 5, which is much slower than the RS-232 based system I have to use now. Even at this speed, I still had problems. It also fails to burn some chips, even at its slowest speed, which will all burn without any problems in the RS-232 burner. And I've tried multiple suppliers of EPROMs.

I really wish Bob could fix the problems. He said he hasn't gotten complaints from very many users, and doesn't seem to be convinced that there really is a problem. If there is anyone out there using Bob's EPROM burner, and if you've experianced any chip failures or hard to burn chips, I really hope that you can tell Bob about it. If he gets more reports of people with problems, then he may take action to fix the device. It would be a nice tool to have, but only if the EPROMs can be trusted.

3783. DGS MAGAZINE - FULL DETAILS

Newsgroup: comp.sys.atari.8bit
Date: 1993-10-02 21:31:34 UTC
From: djg0@aber.ac.uk
Message-ID: <9310022131.AA16946@deca>
Source record: 104745

```
THE NEW D.G.S MAGAZINE - FULL DETAILS
=====================================

You should all have read on the net that we here at DGS are turning the
News-Disk into a new printed magazine. Last time I didn't have many details
to give you all, but pretty much everything is sorted out now.

Name
----

The magazine is going to be called "The Atari 8-bit News-Paper". We have
decided to try and keep the name as similar to "News-Disk" as possible so
people will know what it is! We have changed "Disk" to "Paper" because it
is now on paper and not disk!

Issues per year
---------------

We feel that we should be able to produce 6 issues of the magazine per year.
We will try and keep to issue deadlines, but there is only me and a couple
of guys who help out now and again so the magazine takes a lot of work to put
together.

Content & Style
---------------

The content and style of the magazine will be exactly like the News-Disks.
It will be "light" in style and easy to read. It will cover lots of different
areas including games, hardware, software/hardware reviews, hints, tips,
hardware modifications, new product information, and more! It will also carry
adverts from both UK and US companies. These ads are going to be given free
in the first issue. The magazine is in a very relaxed style and should
hopefully appeal to a wide section of the Atari community. If you have read
and enjoyed the News-Disks then you will like the new magazine!

Subscription Rates
------------------

We have kept costs down to a bare minimum in order to bring you the magazine
at a reasonable price. The first issues are going to be printed in A5 format
in order to keep start-up costs as low as possible. Here are the subscription
rates. We are initially offering subscriptions on a 4 issues basis (as we did
with the News-Disks):

U.K ------------- 6 pounds / 4 issues
Europe ---------- 8 pounds / 4 issues
U.S.A. ---------- 10.50 pounds ($21) / 4 issues
```

Far East
& Rest Of World - 13 pounds / 4 issues

We are able to accept payment in UK Pounds or US$. The price to the USA is quoted in both pounds and dollars. If you are in the UK then payment should be made by cheque or Postal Order. If you are in Europe or the rest of the world then you should pay in UK Pounds by IMO/Bank Draft or other suitable method (no credit cards - sorry!). If you are in the USA then the easiest way to pay is in US$ in cash. We accept payment in US$, but only if paid in cash. If you wish to pay by IMO instead, the cost in pounds is also given above.

All prices shown INCLUDE shipping by Air Mail.

Issue date

The first issue of the magazine is reaching the end of its production stage. The articles have been collected and edited, and final prints have been done. We now need to finish the cover and drop in the adverts, get the copies down to the printers, and pray! We are hoping to release the issue at AMS 7 in just 6 weeks time! That means that the copies have to be with the printers in err well last week really, but I begged them to hold on for them! If we get them back before the show then you should expect to get the first issue around mid-November time.

We need your help!

In order to make the magazine work properly, we need a minimum of 100 subscribers. We currently have around 30 in the UK, but only 2 in the US. The printers will not consider doing a run of less than 100, so at the moment we are having to do far more than we need to and swallow the cost. All I can do is BEG you to subscribe. $21 isn't too much to pay! Also, please tell all the Atari people you know about the News-Paper, and get them to subscribe also.

Help spread the word - upload this posting to as many BBSs as you can. Tell people we exist, get them to subscribe!!

Our details

Please send your name and address with your subscription directly to:

DGS (SUBS.)
62 THOMSON AVE
BALBY
DONCASTER

Well, I can try to give you a short introduction how the boot process is working while loading from a disk. But I think you should better consult some books and papers.

As I can remember (I used to 'play' with the soul of my ATARI 130XE 4 years ago) the booting is like this:

If you have a normal Disk (5 1/4" with a normal DOS) and you watch with an editor onto the first sectors (that means sector 1 to 4) you will notice that there is kinda program code. It is equal to a normal cassette-program. The first byte of the 1th sector is uninteresting. the second will say how much sectors will follow after the 1th to load while booting. If you are checking a normal DOS-Disk it will be the value of 03. 3th and 4th byte is the address where the programm code has to be loaded to. 5th & 6th byte is the start address, where the machine will jump into after loading all the sectors shown in the 2nd byte. All other data will be program code. (Well, it used to be..)

If you boot the DOS-Disk the ATARI will start the small programm on the specified address. The programm itself will load the DOS now.

You see, it is kinda easy to make a normal cassette-file to a disk-file. (If I say normal cassette-file I mean a file, which does not have any boot-program)
You simply have to copy the file onto the disk starting at the sector 1.
I remember that I wrote a small copy-programm for this reason, so I could load my cassette-programs from disk. (I know, there are other methods to do this, but it was only for testing reasons ;)

In this way you will understand, that is possible to make very long 'boot-routines'. What they do doesn't count to much. (Do they load DOS or let you play a game, ...)

If you have a Quad-Disk the code will make the Quad-format understandable (for instance). You can write small program code where you can decide which program on disk you will load by typing a letter on the keyboard. You can write a small hack on the disk while you copy the original sectors into the 1010th (and up) sector. The ATARI will start your hack (showing a frog jumping over the screen) and after that you will start the original code from the behind sectors.

Hope I could give you a overview of the disk-working.
If not then it was a good try (at least).

Hack on!
:c)

Mike

3788. Atari 8-bit items for sale

Newsgroup: comp.sys.atari.8bit
Date: 1993-10-03 21:53:37 UTC
From: cohen@GOMEZ.phys.virginia.edu
Message-ID: <0097379E.AF95CE60@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 104750

The following "stuff" (hardware, software, books) will be sold to best
(reasonable) offer. Please pick up any items you are interested in,
there is NO need to buy everything!
Please e-mail offers to COHEN@GOMEZ.PHYS.VIRGINIA.EDU , or call (804)293-8973
late evenings in case you have no e-mail account (prefer e-mail, please).
I will respond to every e-mail message I get here (if you get no response,
please try again). I intend to finalize sales within a few days, and will
accept immediately offers that look very good (if there will be any).

Thanks!

***** HARDWARE *****

Except where otherwise notes explicitely, all hardware was in working condition
when used last (I no longer have the Atari computer to test it now).
When problems are known to exist, details are given.

Computer- Atari 600XL, with power supply and video cable; no manuals.
Works fine!

Printer- Gemini-10X (Centronics parallel standard interface, for use with Atari
850 unit and parallel cable sold below or equivalent)
Monitor-
1. Monochrome monitor, composite video, no sound, excellent for
80-column work, text-intensive applications and BBS. Picture on
this monitor is MUCH sharper than any color monitor will provide.

Koala Pad Touch Tablet, complete package, cartridge version. In original box,
all part and manuals included, like new condition.

Atari CX853 16K RAM memory module for Atari 800
Axlon RAM CRAM 32K memory module for Atari 800
Modem cable (to any RS232 modem) for Atari 850 unit
Parallel (centronics) printer cable for Atari 850 unit
MPP CARD?/AT centronics parallel printer interface (hooks up a standard parallel
printer to Atari I/O port, no need for 850 unit).
Atari power supply model # C061982 (for the XL/XE series I think).
Atari 1027 Letter Quality printer almost new, in original box, with manual,
but does not work properly
Atari 1020 color printer/ plotter with manual.
Another Atari 1020 Color Printer/plotter with manual, this one need work
on print spool
Atari paddles
Joysticks- various types and shapes, all tested and working well.
Atari 1030 Modem with manual
Taihaho Direct Connect 300/450 baud modem model TH-003 autodial/auto answer

(I think this connects to the joystick port)
Atari 410 Program Recorder (the original one).
Atari 1010 Program Recorder - I have 2 units, Work fine.
Atari 1010 Program Recorder - save: ok, load: no.

4 DISK DRIVES-
2 Atari 1050 drives, 2 Atari 810 drives, all sold as is.
They had various levels of problems, the 1050 spins and the light comes up
but it won't load, and one 1050 and one of the 810 were dead as I recall.

Atari 400- sold as-is, gives no picture on the TV screen.

***** SOFTWARE *****

Cartridges-
==========

Dig Dug
Mountain King by K.BYTE (CBS Software)
Cloudburst by Tensor Technologies (DANA)
Space Invaders
Koala Pad Touch Tablet, complete package, cartridge version. In original box,
all part and manuals included, like new condition.
BASIC (CXL4002) with manual

Disks- (All are original disks)
======
TimeWise with manual and original box
Epyx Summer Games with manual and original box
Strategic Simulations Inc. Computer Baseball with manual and original box
Sargon II with manual and orginal box
Music Construction set with original binder and manual
Pinball Construction set with original binder and manual
Micro League Baseball with manual and original box
Micro League Baseball General Manager/Owners Disk with original box
Atari Translator
Ghostbuster by Activision
CONAN (Datasoft)
Computer Baseball
Atari program Exchange (APX) ATSPEL/AT.WRIT.-program 1.0, by R.S. Kistler
Atari program Exchange (APX) ATSPEL/AT.WRIT.-dictionary 1.0, by R.S. Kistler
Atari DOS 2.5 with manual

plus about 100 generic disks with shareware, and many types of programs
(word processors, terminal emulators, utilities of all sorts, games, etc.)

Cassettes-
==========

Joystick Sketchpad with manual (new, sealed)
apx Eastern Front 1941 (with manual and original box)
Thorn EMI Compute 4 and Reversi (in original box with instructions)
Thorn EMI Snooker and Billiards (in original box with instructions)

Atari Statistics I (with manual and original box)
Atari States and Capitals (CX4112)
Atari Hangman (CX4108)

Books-
======

Bill Carris- Inside Atari BASIC
ICD SpartaDOS Construction Set
Your Atari Computer
Computers for Kids- Atari edition
Albrecht, Finkel and Brown- Atari BASIC- XL Edition
COMPUTE!/Richard Mansfield- Machine Language for Beginners

Please e-mail offers to COHEN@GOMEZ.PHYS.VIRGINIA.EDU , or call (804)293-8973
late evenings in case you have no e-mail account (prefer e-mail, please).

3789. Atari 8 bit software/hardware forsale

Newsgroup: comp.sys.atari.8bit

After a few years of collecting classic videogame and computer systems i have
accumulated MANY duplicates of hardware/software which i have decided to
sell off.

If you would like a copy of my list (prices all listed) please send e-mail to
me at the above address (dh395@cleveland.freenet.edu), also note if you
would like to receive copys of it in the future when i change prices
or add items.

Listed are: 066 Hardware Itmes (Videogame & Computer)

111 Atari 2600 Carts
**********> 059 Atari 8 Bit Disk/Cart/Tapes
045 Books
021 Vic 20 Carts/Tapes
019 5200 Carts
017 PC Software Titles
006 7800 Carts
006 Odyessey 2 Carts
005 Colecovision/ADAM Carts
005 Turbo Grafx 16 Cards
004 Bally Carts
003 Sega Master System (I/II) Carts
002 Telstar Arcade Carts
002 Timex Sinclair Tapes
002 Ti99/4a Carts
002 NES Carts
001 Super NES Carts
001 C64 Softs (Disk)

Packages 004 Intellivision I/II Packages
001 Timex Sinclair Packages
001 Bally Computer Packages

Please reply via e-mail if you would like my list! :)

Thanks

Steve

Have any new drivers been created lately for this old workhorse peice of equipment?

I've just dug mine out of the closet and thought how nice it would be to use it in conjunction with my BBS or something - supposing that good drivers already exist.

I found 2 "fair" drivers on GEnie, but nothing really appealling or useful.

From: jking%smtpgate@uxscosv1.asit.utah.gov
Message-ID: <9310041126.aa15944@uxscosv1.uxscosv1.asit.utah.gov>
Source record: 104754

Help! I have two Adaptec 4000a boards without ROMS, and one complete functional board.

What I need to do is copy the ROM on the good, working Adaptec and make copies for the two empty boards.

Does anybody know what type of ROM/PROM Adaptec used on that card? Without that info, I'm unable to duplicate that chip to fix my other Adaptec boards.

Trying to add another 100meg to my little Atari 130xe (with 1meg) BBS system! <grin>

I am trying to download files from the archive..

I'm using a frenet as my mailbox and then putting the mail in my work dir.

Then I download it to my 130xe and try and use UUDECODE ..

But the program (taken from the archive)doesnt want to decode!!!
HELP!!!

Please e-mail me as soon as you can !!

Thanks in advance!!!

First, if the file has ascii cr/lf characters, you need to convert them to Atari EOL characters. Next, if the file was split into two or more e-mail messages, you need to append them together and edit out the headers and footers. If you still have trouble, post again.

Source record: 104658

I was looking through "Mapping the Atari" (Revised Edition) and I found
some references to a "relocatable loader" in the 500 (decimal) range.
Is there really a relcating loader on the 8 bit? How do >I< use it?
Way back when (7 years ago?) I remember people were trying to hash out
such a format, but I don't remember if any standard was achieved.
Even if such a format was created, how would I get my compiled Action!
code into the proper format?

Anyone know what this relcatable loader is all about?
Enquiring minds etc...

The latest catalog which I have from American Technavision lists 2
versions of Mapping the Atari, one for the older 400/800 and one for
the later XL/XE versions (which has a section on 130XE memory
management). They have a toll-free order number (800) 551-9995

Actually the Communicator II packages are quite cool! They are the usual
oversized silver boxes from the good old days of yore. But they
contain, within their midst, the often hard to get ahold of Telelink II
cartridge. Telelink I is relatively easy to find but II was always a source
of consternation for me (Yup, I used to collect 8-bit carts). Besides
if they are still sealed like they contain $15 worth of CIS time which
is still valid AND is actually worth more time NOW than when they
issued the credits! If I still had an 8-bit I would have snapped 'em
up. OOOOOH, it is soooo hard not to get back into the good ol' 8-bit!

3803. LAST CALL! MAILOUT NEXT MONDAY! ALL MYDOS WANTERS!!!!

Newsgroup: comp.sys.atari.8bit
Date: 1993-10-06 07:24:15 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <5emZac1w165w@cyberden.sf.ca.us>
Source record: 104668

Alright. The MyDOS disk is currently going to be mailed to the following people:

"Dallas" California

Shawn Ledbetter California

Richard Friedrich Texas

The following files will be included on the disk:

DOS.SYS MyDOS 4.53/4
DUP.SYS MyDOS menu interface
MYDOS.ARC ARC-compressed copy of the MyDOS Documents
TECH.ARC ARC-compressed copy of the Techincal Documents
VTOCFIX.COM Volume Table of Contents (disk directory) fixer
UNARC24.COM Super UnARC 2.4
ARC24.COM Super ARC 2.4
DSKCOM32.COM Disk Communicator 3.2
FILEFIX2.COM Disk Comm. file fixer
HYPER2.COM Hyper E: screen accelerator
CUSTOM.AR0 Simple autorun file to set screen up nicely
README.TXT File version of documents for this disk

Included will be:

The disk You make your own backup copy of it
The README.TXT printed So you know how to boot up the disk, etc.
Receivers' names printed So you can mail the next person

The mail out will be handled as follows (note: once mailed out, this things out of my hands, so to speak!):

You receive the disk and printed pages in the mail
You get a blank disk and duplicate the MyDOS disk as explained
You cross out your name from the name/address list
You package it all up with postage and send it off to the next person on the list after yourself.

So you're left with your own copy of a disk, and a little less postage money and a warm feeling in your heart :) ...

SO!!! LAST CALLS! Who requires a copy of MyDOS and some utils and has no access to them! (ie, no modem, no Atarian friends close by, etc.)

I'm not including a terminal, as BobTerm is a bit big and may require an extra disk (I'm going to format this double-sided, SINGLE-DENSITY for any 810 users..)

REPLY NOW! MAILOUT STARTS ON MONDAY (if I'm lucky)

..... and they're OFF!

"Roh kay, raggy..."

You could try the Page 6 Accessory Shop, or Gralin International, both in the UK. Page 6 are in Stafford, and Gralin are in Poole, but I can't remember the addresses exactly

Page 6 is something like
PO Box 54
Stafford

and Gralin is something like
Parkstone Road
Poole
Dorset

If you can find the faq file, the Page 6 address is definitely there, and you could try getting in touch with Gralin via the address for 8:16 (I think it's the same people) if their address is not in the faq.

If anyone in the UK has Mapping the Atari, it will be one of these two sources.

I'll check out the correct addresses when I get home.

Hope this helps
Geoff

3805. I'm back

Well after ten weeks away I'm back, did I miss anything?

While on my journeys (in Panama) I saw brand new 130XE's boxed and straight
off the shelf going for $238. How's about that! Do Atari Corp. still make
8-bits or were these just just left over stock?
Didn't see any drives tho, but I did see loads of 2600 still on sale!

Raphael Espino, rje@cs.nott.ac.uk

3806. Does MODPL122.DCM work on 800 classic?

Newsgroup: comp.sys.atari.8bit
Date: 1993-10-06 16:02:23 UTC
From: chacala@vcd.hp.com
Message-ID: <CEHGK0.14s@vcd.hp.com>
Source record: 104667

I appologize if this has been discussed before...

Does the mod player program work on an Atari 800, or do I need an XL/XE system?

I have downloaded MODPL122.DCM and used DISKCOMM.COM to unpack the disk. When I boot it on my Atari 800 (classic, no XL) it loads for a while and comes up with the title screen. Then it displays a message that there are no MODs on the disk, even though there is the one that comes with it. The audio has been quieted by the program, but you can still (barely) hear it loading, then it starts making a "boot error" sound and the drive just spins indefinitely.

If you know whether this program works or not on an Atari 800, I would appreciate your response.

Thanks,
Chuck
chacala@vcd.hp.com

Hey all you Atari-ists out there in Dallas!

Our faithful dealer (the ONLY one left) is having a used hardware sale.

Here's what he's got:

Mega 4ST with 19" 2-page moniterm mono monitor + 16 Mhz accelerator
This system is IDEAL for desktop publishing
$899.95

Mega 4ST with 19" 2-page moniterm mono monitor 8 Mhz $750.00

Mega 4STE with 120 MB HDD $900.00

Syquest Dual 44 MB removable HDD with 2 drives/cartridges
plus ICD link (GREAT for backup system) SOLD!!!

SC1224 color monitor $200.00

SLM 804 laser printer with extra toner cartridge $450.00

160 MB HDD $400.00

1040 ST with TOS 2.06 $300.00

1040 STE with 1 MB RAM $300.00

SM124 mono monitor $ 75.00

Omniswitch interface for multisync monitor $ 50.00

Plus HUGE discounts on all new and old software like :

Word Writer ST, Data Manager, SwiftCalc, BEST Accounting, Timeworks DTP
Word Flair, Word Up and TONS more

All prices are negotiable - no reasonable offer will be refused.

Help us keep our last dealer in Dallas alive and well!

I have an Atari 800 for sale, with lots of stuff to go
with it:

Indus GT drive
Koala Pad
13 inch color monitor
4 joysticks
gobs of software (originals, not pirated)
cassette tape drive
lots of floppy diskettes
disk box
Gorilla printer interface

There are probably some things I'm forgetting to mention. If you
have an interest in the system or any part of it, email me and we'll
work something out.

Not that I can see. I tried booting it up on my old 800, and got similar
results to what you describe. I don't know what the problem is.

Does anyone out there know how to make MODPL122 play DSDD disks? I find
I can only use SSSD or SSED disks. With .mods in the 60K - 90KByte range,
you can usually only fit one per side per disk.

Hey there-
I'm one of those people who look bittersweetly upon their
recollections of their old Atari 800XLs....but I digress.
What I'm interested in now is the Atari 800, and
especially the four joystick ports. This is such a brilliant
idea! the only games I play now are 2 or more players (Yey
college life) Why didn't the XLs have this? Is there a good
reason beyond the official "well, most games didn't support
four anyway"??? And what games *did* support it? Did they
have M.U.L.E. for the 800(classic)? I'm really interested in this---
If the hardware and 4 player software were readily availible
I might try to get back into it...

I can't help you on the OS part, but I do know of a few relocatable formats.

The MAE assembler, from 1982-3 or so, created a completely relocatable file format that was actually pretty nice. It allowed separate relocation of code, data, and zero-page addresses. It required a utility program to load the files.

The SpartaDOS X cartridge has a relocatable format built into it. I don't know much about it, since a utility was never distributed to create files in this format. It would have to be reverse engineered.

The driver for the XEP80 80 column module comes with source code for a crude relocation system. Again, I don't know of any ability to easily create files with this scheme though.

There weren't all that many games supporting 4 ports, but MULE
was definitely one of them. And the others were:

Basketball (Atari) -- pretty much like the 2600 game (as seen
in the movie "Airplane") but supported 4 players.

Breakout (Atari) -- Supported EIGHT players (2 paddles per
port); overkill considering it wasn't head-to-head

Maze War -- a freeware maze/shoot-out game.. would be neat
to play! (ask and I'll upload it to atari.archive.umich.edu)

MULE (EA/Ozark) -- well, y'know, great game, yadda-yadda-yadda.

Silicon Warrior (Epyx) -- Kind've a Tic-Tac-Toe and Shoot-Out.
Defend the houses of Peanut, Apple, Adam and... a 4th I can't
remember.

Survivor (Synapse) -- I _think_ it supports 4.

And that's all I know of... Once Atari made the 1200XL they
weren't about to make use of the 400/800's special features.

I wonder if they planned an enhanced 4-player port of the 2600
"Indy 500" game? (or an 8 player "Video Olympics"... Octapong?
8 player Fooz-Ball?)

Not many I can remember... there were:

1. M.U.L.E.
2. TANK COMBAT (4 player version of the 2600 cartridge COMBAT)
3. Air Battle/Combat (not sure of name) - you had one of four P/M single color airships and would try to eliminate the other players.
4. Vo... shoot... can't recall... some commercial game, something like Gauntlet... came out a few years before it too I think... Low res. graphics, but playable.
5. Return of Heracles - but not all 4 moved at once!

(#2 and 3 were PD as I recall)

I use all the RAM underneath the ROM. Sadly, it is impossible to disable
the ROM on an old 800...

> Does anyone out there know how to make MODPL122 play DSDD disks? I find
> I can only use SSSD or SSED disks. With .mods in the 60K - 90KByte range,
> you can usually only fit one per side per disk.

This is impossible. You need disks with 128 Bytes per sector. The reason of
that is very simple. I do not use any DOS.SYS, to save memory space for
bigger MOD-Files. (Compare : DOS.SYS is ca. 5KB and my loader is only a
few hundred bytes.) My loader directly reads the directory sectors and
finds out what sectors to read for a certain mod-file. I do not support
256 Bytes/sector because I am not able to test it myself. (I am one
of the rare owners of a virgin 1050) I decided that it's better that I
don't support it rather then having lots of bugs...

>intended to generate 6502 code as output, right?

Kill all the #asm stuff. Although there inclusion is nice for those
who want to build C code with embedded asm statements, it just
wrecks a lot of other C compilers. This code should be in separate
files and included at the as stage, not at the cc stage.

... except that if I'd built it that way, I'd never have been able to
get CC65 to fit in the space required. The inline assembly code really
is there for a reason.

>>Now I don't get errors but still a whole bunch of the same warnings.
>>(illegal combination of pointer and integer, op =).

cc65 often treats char * and int as the same beast. These warnings
should not present problems on most computers. Some will be killed
by this, however.

>>The changes in makefile are mostly changed back again. Most of them where
>>due to my lack of knowledge about the system. e.q. it couldn't find
>>gcrt0.o because $GNULIB wasn't defined. Now it is. But there is still one
>>thing. The -lgnu switch for the linker. I don't know where to find the
>>gnu-library, so I changed it into # -lgnu.

Most compilers don't need this. This is an Atari ST specific thing.

Right. It was supposed to have said so, in the doc. That makefile was
only supposed to be used as an example, it was never purported to work
on any old random system.

3820. Re: Relocating loader

The code produced by CC65 (John Dunning's C package for the Atari 8-bit) is also relocatable. I believe the assembler component can be used in and of itself to produce relocatable code; this does require a special loader which is also part of the CC65 package.

This is for M.S. Cheers, sorry if I repeat any answers already made, I'm behind in catching up with old Digests.

No color is most usually due to: 1.) a misadjusted color pot 2.) a bad GTIA 3.) bad diodes or transistor in the color adjust circuit

The December issue of ATARI CLASSICS will be focused almost entirely on video in the 8bits & will include 2 articles describing how to properly adjust the color pot & also describing the theory of operation of the color circuit & how the color bias on GTIA is derived directly from the clock crystal.

Hi! I'm a replicating .sig virus! Join in the fun and copy me into yours!

I can only remember MULE and Snowball Fight! SF was a GREAT!
^^^^^^
game! I think it was prob'ly one of the most fun games I had...
Too bad it crashed all the time. You controled a little man
on a hill covered with snow. You would press down to collect
snow and you could either drop it to build a wall (fort) or
throw it. The wind would blow a small snowball off course and
you couldnt throw a large one very far. It was actually
pretty complex... What a blast from the past... sigh

I think the game you're thinking of is one called 'Dandy,' which was a very primitive (but surprisingly similar, I wonder if this resulted in the arcade game) version of what we'd see as Gauntlet a few years later. APX was the publishing house that produced it - I'm thinking it was a game by John Palevich.

Not too sure for certain, but I think it was the one. 1983 or so. I used to drool over games in the APX catalog when I was a little kid with a 400, but alas, those days are gone...

Yep, SF was a true classic. If you have an Atari ST, you can get my
updated version with digitized voices for the kiddies, too. (It doesn't
crash as much as the original either!). It's on atari.archive.umich.edu,
in the Double-Click directory. It might also be cross-linked into the
games directory.

>escapes me). It makes the E:ditor go WAY fast... but ESCape codes screw up
>(trying using it with the View command on BobTerm! BOB! SET LOCATION 766
>TO ONE! DONT SEND ESCAPES TO THE EDITOR! ARGH!) Sorry..

Hyper E: is version 1.2JH. It's my not-so-subtle way to stick in my
initials without removing the credits of the original author.

I found the problem that causes BobTerm to display all those Esc codes. I
was not clearing $2A2 after displaying characters. I'm still puzzled about
why Bob is sending all those useless Esc bytes mixed in with normal text.
It sure slows down the View function too. (Maybe that's a deliberate
attempt???)

I also fixed a crashing problem on system reset.

Watch for a version 1.3JH soon.

> some snazzy stuff for loss of sound quality...

> :) This may suck for you, Poorten.. maybe your reeeally nifty #1 MOD
> player may be put WAY out of date by #2?

I don't think so. First of all, my MOD-Player isn't the first, but there
was a Polish one before. Let's compare...

Polish MOD-Player - MODs need to be converted to MD8 format first.
Need a 130XE for that !
Sound quality slightly worse then my player.
Player is PD but converter has to be bought.
Does not use RAM-Banks.
MODPlay v1.22 - Loads standard 31-channel MOD-Files.
No conversion needed.
100% Public Domain.
Does not use RAM-Banks.
Friday's Player - MODs need to be converted to MD8 format first.
It's *not* Public Domain but comercially sold !
It does use 130XE extra RAM
Sound quality comparable to MODPlay

O.K., the Polish one is out of date, but it's up to you, to choose between
buying Friday's Player and having to convert all your MOD-files first but
being able to play files of +-220KB, or just copy MODPlay for free...
(I think the difference isn't too much. It's just a matter of what
suits your needs best.)

> But hey... people still use SpartaDOS! Go figure! ;)

And... loose all the RAM underneath the ROM plus some more in lowmem...
14K+2=16 --> 48-16=32
That leaves you with a buffer of 32 KB (= Modfiles of max. 64KB)
Sounds great ! (NOT!)

> (jk everyone hehehehehehe)

> Anyways... do you get your player to use up ALLLLL the cycles?

Offcourse, all is done in the mainloop. Only one flag is set in the NMI once
in the (SPEED) times.

Hey there-
I'm thinking about getting a used Atari 800 just for the
4 player capacity...is there anyone one out there who has a lot of
old classic 4 player games (I've heard of M.U.L.E., Soccer,
Asteroids, and the PD games Snowball and maybe Dandy?) or for
that matter, lots of regular games, who would be willing to send
me copies for the price of the disks+shipping+some for your
time? (I hate to sound like an ass, but I have no qualms
about copying games that are essentially impossible to now
acquire through legitimate means...)
Would Archon, Archon 2, Mail Order Monsters, et al, be
playable on an 800 Classic, or do they require 64K?
And I remember once seeing a (gray/black-market?) catalog
sheet from a company that would sell you like 4 commercial games on
one disk- can anyone give me any information on that, and the legitimacy
of that?
Thanks,
KIRK

Actually, Gauntlet was based on this game as far as I recall, so it's hardly surprising that the two games are similar.
Dandy Dungeons was one of the user-written programs released by the APX (Atari Program eXchange) which was a wonderful idea - write software for the Atari, send it to Atari, if they like it, they market it and you're in with the chance of winning prizes - I think the big prize used to be $25000. Pity Atari dropped it (then again, pity Atari dropped everything they ever developed!)

>(erro 152 i think)

What uudecoder are using? (apparently not uue!)

So let's see, first you had a uuencoded copy of uue.arc. You uudecoded
this with some uudecoder, which gave you uue.arc.

Then, you un-arc'd uue.arc with some arc program (which one? Super
Un-Arc?), and what files did you come up with at this point?

3838. Futura - A Disk Magazine

Newsgroup: comp.sys.atari.8bit
Date: 1993-10-08 18:04:11 UTC
From: Michael Edwards <Q0J0@UNB.CA>
Message-ID: <08OCT93.15195335.0195@UNBVM1.CSD.UNB.CA>
Source record: 104700

I was wondering if people are aware of a disk based magazine coming out of Aberdeen in Scotland called 'Futura' Its rather good with lots of text articles and some of the more obscure public domain programs. I don't have the address and subscription rates on hand but if anyone is interested then get in touch and I will let you know. It is actually from the North Of Scotland Atari User Group of which I am the co-founding member but now I am in Canada at university so am doing some additional advertising!

I am also looking for 2600 VCS cartridges as I am trying to put together a very extensive library so anyone willing to sell can also get in touch.

Thanks a lot - Michael Edwards.

3839. Help with "Sands of Egypt"

HELP!!

Has anyone solved the old program "Sands of Egypt"? If
so, how do you get out of the treasure room. I know
I am very close but after close to 10 years, I give up.

Please e-mail me the answer.

Thanks

Bert

3840. wanted for 800xl

Newsgroup: comp.sys.atari.8bit
Date: 1993-10-08 20:25:53 UTC
From: otto@garnet.acns.fsu.edu
Message-ID: <otto-081093162320@hotline.cc.fsu.edu>
Source record: 104702

Does anyone have any of the following for an Atari 800xl:

Hayes Smartmodem 1200 or 2400 baud or compatible with cable
which has a speaker and status indicator lights
terminal emulator
including VT-100
handle down-/up-loads
directory

Adapter cable for Gorilla Bananna printer (25 pin) or
just a decent, cheap printer with cable

1050 disc drive or equivalent

Also, I'm having a problem with the XL. If I use the
computer for any amount of time, and then turn it off,
I have to wait 30-45 minutes before I can turn it on again
and boot up. It'll just give me a black to grey screen
and not the blue for booting.

3842. IBM software to write Atari disk format?

Newsgroup: comp.sys.atari.8bit
Date: 1993-10-08 22:34:39 UTC
From: ind00052@pegasus
Message-ID: <294ptv$qio@osceola.cs.ucf.edu>
Source record: 104704

I'm looking for some software that will allow my IBM to write Atari format disks which will be readable by my 1050 drive. Does anything like this exist? I have a few programs I'd like to run, but they're doing no good sitting on my IBM. I would use the 850 interface, but it just makes fuzzy noise when I try to initialize it (when it worked it used to beep). Anyone have any ideas?

Sen

Archon was written on an 800, same with the other two if I recall. What's so funny is that some of the mail order companies "THEN and NOW" mention in their ads that the games "listed below" won't work on the older 800's - I have MOST of the games they list, and they work perfectly fine on the old 800!

BTW: Good luck finding soccer... it's a great game tho!

F-15 Strike Eagle (and some other earlier MicroProse sims,
Hellcat Ace was one) supported a second stick for throttle
and weapons control.

Space Dungeon used two (ported from the 5200).

Food Fight and Battlezone I don't think supported two.
Robotron came with a large holder for two standard Atari
sticks.

>have any ideas?

From the FAQ List:

Can I read/write 8-bit Atari disks on an IBM-PC?
There are several programs on the atari.archive of this variety. Note
that most require a DOS and disk drive on the Atari end capable of the
SS/DD
180K format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs
are:
ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
8bit/Diskutils/atario21.arc

Mule by Rick Cortese - Reads/Writes SS/ED 128K Atari disks. Very limited.
8bit/Diskutils/mule.arc - includes Atari Mule; Action!, Turbo C
sources 8bit/Diskutils/mule.exe - IBM Mule
8bit/Diskutils/mule.txt - descriptive blurb

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks. Filename:
8bit/Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Quite
popular. 8bit/Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and
ataridsk.arc)

:) You've probably never heard of SIO2P@ or the Bla<k Box, have you?
Neither are EMULATORs, BUT:

SIO2P@ lets you use an IBM as tho it were a fileserver...
ie, use ITs hard drive
and
Bla<k Box lets you @onne<t up to about 130meg of HD spa<e at
any given time, and in @onjun<tion with the Floppy-
Board, also allows you to @onne<t IBM floppies!
As BB stands it does S@SI hard drive, up to 14.4k bps
modem (19.2k? yeah I think thats more like it, altho
I've never seen any over-the-phone modes that spe<ifi<-
ally SUPPORT 19.2k.. only up to 14.4k anyways who
@ARE!?), and @entroni<s-type printers.

Details are probably in the F.A.Q., and I'm sure @.S.S.'s address (they
make it) is in the vendors-list
part of the F.A.Q.

Yes the do but be warned, most like UTIL will only work with an IBM
180K disk drive. If you only have a 1.2M like most do then you are
out of luck.

Hey.. thanx for clearing all that up. I didn't know that Friday's was
commercial! I can imagine how yours would be better because it uses as
many cycles as possible. From what I tried to read of Friday's, it looks
like it has a bunch of extra fancy stuff. Oh well. Hmm.. maybe if
Friday's is cheap enough, I might buy it just to see what else it can
do.. but I suppose I'm gonna stick to yours for quite a while!

And, Mr. Gatekeeper, that original Somebody (?) was ME :^P .. and I
knew all about your lack of hardware. I still think it'd be really nice
to put this extra RAM of mine to work, seeing as I can't even use it as a
RAMdisk.

But still..! don't get all upset at me! I sit here complaining about
superb things like BobTerm! I'm just never satisfied!

and don't say "switch platforms"].. never gonna happen.
Sure, I'll be forced to conform and probably buy an IBM or Mac, but I'm sticking with my beautiful 1200xl's (and whatever other Atari's I eventually get my hands on) forEVER! :)

And when did that Polish player come out?? Who wrote it? Why hadn't we seen that one or yours until now!!! Almost a year later at least!

Thanx again...

Battlezone has two sticks, but each controls a seperate tank tread.

Black Widow pops to mind (especially since its sitting in my spare room at the moment) as using the same 1 joystick to move, 1 joystick to fire as Robotron 2084 did.

Odd how ya forget about things sometime isn't it? Like I was heavily into the Atari 8-bit from 1980-1993. I was always "on top of things" Atari so to speak. But back several months ago, I took the plunge and got a Mac. Between that, and a particularly hot and sunny summer here in the northeast, the Atari got pushed aside. I still have been getting my AtariClassics magazines, and my New Atari User from England, but it just occured to me now that I haven't gotten an AtariUser in a LONG time even though I know I had many issues left on my subscription. So, the obvious question : whatever happened to them????????????

I have a bunch of miscellaneous items taking up space ...

1) A laptop computer: two 3.5" drives, complete with power cables and manuals, PC-compatible. Also has a Toshiba ink-jet printer that I'll include. Works fine, but now I have a PC. Asking $250 obo.

2) A mini-refrigerator. The standard cubic model for a dorm. Works fine; paid $100, make offer.

3) Coffee table. Very nice, with two pieces of glass. It's just that I have another coffee table that I like better. =) Asking $50.
Also, I have two hexagonal end tables; both for $20.

Call me (510) 549-2921 to come by and see them, or [if my line is busy] send me email: tlin@stat.berkeley.edu

P.S. I would love to trade some of these for Atari 8-bit hard- and soft-ware. =)

I don't remember the story as to why they couldn't get an issue out for a
while (it wasn't just financial reasons), but they just recently got one
out again. If you're still subscribed, I supposed you'll see it soon.

But they haven't had any 8-bit coverage since their first year, have they?

>I saw anyway). I read the FAQ and it mentioned several FTPs, but I do
>not have FTP on my account. Does anyone know how to access the FTP
>sites using email? Are there any others not mentioned in the FAQ?

The FAQ List mentions two FTP sites: atari.archive.umich.edu and its
mirrors, and one other one that hasn't seen any uploads in ages. Very
likely that's all there is.

Besides BART (the file-mailer for atari.archive.umich.edu), the FAQ List
also contains information on how to use two all-purpose FTP-by-mail
services.

Anyone who wants the latest copy (it's still at 30-Aug-93) just let me
know.

Try an ST mouse. It might not be _quite_ as hard to find, and I think
it gives better control.

A few weeks ago I saw a PC clone with arcade games like Missile
Command and Centipede running under windows-- looked and played better
than on my 1200XL, especially since I could use the mouse with
Centipede. Why didn't Atari let us use the trackball for Centipede?
(In trackball mode, not joystick mode)

Have you tried pressing [RESET] when you first power up, or as you power up? Then release it. My 1200xl used to get like that a lot, esp. after using @arts. It just refused to boot! (@an anyone explain?)

I don't think Atari is still producing the 8-bit in any quantity,
probably just left over stock. Pretty good if they can be sold at
those prices...

Unfortunately, I don't think there is a way to do it right now,
unless MODPL's disk routines are rewritten to access DOS. I assume it
was probably done to make the player as small as possible to larger .MOD
files can be played. Sure wish it would work with DSDD (or hard drives)
for that matter.

You might try MTS Creations (POBox 56762 Chicago, Il 60656) or call 1-312-763-1822 (as advertised on page 80 of Current Notes - Sept 93 edition). Their ad copy did not include an 8 bit trackball, but he has them and will sell them for $5 plus shipping (at least that was the price he quoted me - I did order the 8 bit ball along with a pair of ST converted trak-balls - one set up for a left-hander with the buttons switch reversible. Just order Friday so haven't received them yet.) Wayne

It is too bad that this article wasnt posted earlier this summer, because
I bought an XL setup from a school which was chocked full of educational
diskettes. However, I think I formatted most (if not all) of them for the
space. Most of these games and programs were oriented towards younger
children (i.e. simple math, and reading skills). I will try to find
out if any of these disks still exist and get back to the newsgroup.

Maze War should already be on the archive along with another
of mine called Killer 'thello (inspired by Killer Chess); which
also supports up to 4 players simultaneously.

> Survivor (Synapse) -- I _think_ it supports 4.

Survivor does support 4 players, but it's mostly unplayable
in that mode (one player thrusts, one player shoots, one turns
left, and the last turns right). It does play pretty well in
in 2 player mode though...

3872. Atari Basic Crashes?

Newsgroup: comp.sys.atari.8bit
Date: 1993-10-11 21:52:11 UTC
From: go1n@ellis.uchicago.edu
Message-ID: <1993Oct11.215211.22742@midway.uchicago.edu>
Source record: 104581

Back many years ago, I used to avidly write atari basic programs on my 800. Sometimes after especially long sessions the basic editor would die on me. When I typed list I got garbage. Needless to say this was very frustrating because backing my programs up was fruitless considering my 410 program recorder's ~30% success rate (sigh).

I remember reading once why the basic cart would do that but have since forgotten. If anyone remembers/knows why I'd be interested in a detailed explanation.

Thanks in advance....

Steve

.8bit lurker...

3873. Writing Atari Disk formats...

Newsgroup: comp.sys.atari.8bit
Date: 1993-10-11 22:05:16 UTC
From: ind00052@pegasus
Message-ID: <29clas$dl6@osceola.cs.ucf.edu>
Source record: 104583

Does the mentioned UTIL program write disks that are directly readable by
an atari 1050 drive? Or does there have to be some kind of decoding program
on the atari end to read the disks and then rewrite them, etc.?
The reason I'm curious is because I have no way to get the "decoding"
program over to the Atari if it's neccessary. By the way, if one is
needed would anyone be so kind to mail me a copy on Atari ss/sd format?

Thanks!

Sen

3874. MicroMiser

Newsgroup: comp.sys.atari.8bit
Date: 1993-10-11 22:05:37 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9310112143.AA15803@smithkline.com>
Source record: 104582

Well, time is only part of the equation. There was also the little matter of arranging to pay the guy the $1000 he was asking. Then arranging to have someone clean up the code (which MicroMiser claimed was "clean"- that's a joke!). And then arranging to have the thing produced & sold. I don't think anyone appreciates how complex these arrangements can get, & the sheer amount of TIME you spend making sure all the pieces fit. And trying to do this while putting in 45 hours a week on my real job plus 30 hours a week on AC. I bit off way more than I could chew, I had no idea what I was getting into. If I had nothing else to do with my time, I could probably have put up with MicroMiser's paranoid behavior & pursued the thing to ultimate success. But my entire involvement was calculated upon the transaction for software rights going smoothly. It didn't happen that way, & the time I had alotted for the project all ended up being squandered in variouis attempts to placate MicroMiser's neurotic ways. Kind of like walking into the casino to play the slots with $10 worth of dimes & hoping like hell you'll win the jackpot before your $10 is gone. I came up short before I got the payoff. Demoralizing.

My advice to anybody who takes a notion to rescue rights to a program:

*** "Make sure you get yoursself a BIG SACK of dimes!! ***

Well, I'm prety good a hacking the analog parts of the computer, & so far I'm doing pretty well running North America's only successful all-8bit publication. I'm only one fellow, I reckon that's about all I have to give to the community. I'm going to concentrate on those areas, that's what I do best.

3875. CSS EPROM Burner

Newsgroup: comp.sys.atari.8bit
Date: 1993-10-11 22:55:14 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9310112205.AA15969@smithkline.com>
Source record: 104584

I got the CSS Gang Burner a year or 2 ago. Got 2 of them now, they both seem to work OK.

However, the first one I bought had to be returned, it was flaky. Took me a long time (translation: a hideous amount of WASTED time) to figure out the fault was with the burner. Some of the ROMs I burnt didn't perform properly. Checked them on the EPROM reader, they didn't give back the original checksum. Read them 3 times, get 3 different checksums! So.... which one represented the REAL ROM???

Erased & re-burned the ROMs. Put the ROMs in service, they were flaky. One time they work, another time not. Try reading the checksums, sometimes they check, sometimes not. Weak bits or something. No help re-burning at longer times, like 6 (I use 3 as standard). Things finally got to the point where I lost all trust in it, that's when I sent it back to CSS.

After some weeks CSS returned it. There are 2 large chips on the burner board, 6821's???? I think. They had been replaced. Since then the burner has been reliable. For example, Bob lets me buy just the "brain module" part of the XF551 upgrade at a reduced price vs.the whole pkg. & doesn't object to my burning my own ROMs for the ROM part of the upgrade. I"ve been using several of those home-made ROMs in my 3.5" upgraded XF551's for over a year now with no problems.

My gut feeling is that the burner is probably designed properly, but that the design was based on certain 6821(???) chip specs. If Bob gets a batch of marginal 6821's the performance rating takes a nosedive... but it's hard to detect.

I insisted that Bob should burn some ROMs on a known good burner & supply those with my returned unit, which he did. (Some kind of junk code, just for testing purposes.) He sent back 2 good ROMs plus a 3rd one which he thought was flaky. The checksums were written on all 3 ROMs. The 2 good ones checked, the "flaky" one didn't. Now at least if I suspect my burner is on the fritz, I can try checking the known good test ROMs to determine if my burner is going south or if I just got a bad EPROM.

I advised Bob that I thought he should provide known good standard test ROMs with each burner he sells, so people won't have to go thru all the agony of messing with a flaky burner. But, when I bought my 2nd burner some months later, it did not come with test ROMs. <sigh>

I will also say I've found TREMENDOUS differences among EPROMs. I now have an enormous collection of EPROMs, mostly salvaged from the junk my employer throws away (!). I've also bought new ones & "surplus" ROMs from BG Micro. Some of the "surplus" ROMs won't accept a burn until they've been erased-- even tho they

check empty to begin with! And, I've given up entirely on Mitsubishi ROMs. All the Mitsubishis I've seen have raised windows. If you get one that's already been written to, you can never erase it. I have a Jameco eraser & typically erase for 15 min. when my lamp is new. I'll typically cook the chips, then read. If they check clear, I put them in my "good" pile. If they aren't clear, I'll cook again for 15 minutes, then read again, & so on. With Mitsubishi ROMs I went thru this cycle 8 TIMES (!). They NEVER cleared! Instead, after 2 hours of cooking they just went defective. I've now learned that if I can't clear a chip after 2 cycles it's best to just toss it.

Intel & Hitachi ROMs seem the best to me. Not sure about TI, sometimes those are flaky. I don't even bother with Mitsubishi any more.

There was one more complaint I lodged with CSS about the Burner, which I doubt has been fixed. The damn thing cannot distinguish between a blank ROM & an empty socket! In other words, if you try verifying an empty socket, the burner will happily generate a checksum for the empty socket. I was bummed out. That's why I insisted on Bob supplying me with dummy check-ROMs so I could determine performance relative to an external standard. It just seems to me that any burner should have enough "smarts" to know when there is, or is not, a ROM in the socket. Sheesh.

It has something to do with the routines that delete code. When editing
code, there was a bug in Rev B Basic that would kick in when deleting
code of a certain byte count. There is a patch for this bug.

Also, Rev B Basic adds 16 extra bytes to your program with each Save.
To get rid of this wasted space, you had to LIST the program and then ENTER it.

>have M.U.L.E. for the 800(classic)? I'm really interested in this---

Yes. M.U.L.E. is a classic, great, Atari 800 game.
"Return of Herakles" will also run with 4 players, and is worth playing
through at least once. (Though, by the time you solve it, you can whip
the entire game playing just Asclepius and Achilles. Not that I've done
this, or anything....)

Archon and Archon 2 work on the classic 800. Mail Order Monsters (at
least the time I tried to play it) does NOT work. It is a fairly cool
game, but I have only seen it work on XL/XEs.

I'd also like to suggest getting a copy of BASIC XL if you should find one... It is a monumental piece of work, a great improvement over any Atari Basics, Microsoft Basic for Atari, & a few other Atari BASICs I've used. Basic XL was downward-compatible with Atari BASIC, and included a run-time compiler to share your programs....

The original 800 did not have BASIC built-in. The first Atari BASIC
cartridge was Revision A. It had a bug that would cause everything
to lock up. It had to do with the memory management routines in the
BASIC editor. If you inserted a line in a BASIC program anywhere
except at the end, BASIC would have to move lines down to make room
for your inserted line. If the number of bytes moved was exactly 256
(or a multiple thereof), everything would lock up and you were out
all the changes since the last SAVE.

Revision B BASIC was built into the early 600XL and 800XL machines.
It had problems of it's own as mentioned in an earlier followup message.

Revision C BASIC came along and was built in the later XL machines as
well as the XE series. A Revision C cartridge was offered by Atari
to correct the previous revisions (it wasn't free, though--you had to
pay $15 to Atari Customer Relations).

There is a PEEK command that will tell you what Revision of BASIC you
have. I have the info at home and could post it tomorrow if anyone
is interested.

In October, the Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST)
Atari user group will have a general meeting.

Our 16-bit library currently has over 400 disks of public domain
and shareware software.
In addition, there will be our updated catalog disk and our
disk-of-the-month.
Our 8-bit library is also available.

As well our own newsletter "The Hard Copy" will be given to attendees.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Room opens at 7:00 pm. Meeting starts at 7:30 pm.

Wednesday, October 13, 1993
DCS Course Room, Room 2009 (2nd floor)

Call 725-2068 for more information.

Hope to see you there,
Dani Roloson

Date: 1993-10-13 01:48:44 UTC
From: aa700@cleveland.Freenet.Edu
Message-ID: <29fmps$8k3@usenet.INS.CWRU.Edu>
Source record: 104604

In a previous article, ind00052@pegasus (Sen) says:

>
>Does the mentioned UTIL program write disks that are directly readable by
>an atari 1050 drive? Or does there have to be some kind of decoding program
>on the atari end to read the disks and then rewrite them, etc.?
>The reason I'm curious is because I have no way to get the "decoding"
>program over to the Atari if it's neccessary. By the way, if one is
>needed would anyone be so kind to mail me a copy on Atari ss/sd format?

No decoding happens on the Atari end, but you need a 180K or greater Atari
drive to use UTIL. For a stock 1050 your only choice is Rick Cortese's Mule.
And Mule DOES have software on the Atari end.
Quoting from the FAQ List:

Can I read/write 8-bit Atari disks on an IBM-PC?
There are several programs on the atari.archive of this variety. Note
that most require a DOS and disk drive on the Atari end capable of the
SS/DD
180K format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs
are:
ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
8bit/Diskutils/atario21.arc

Mule by Rick Cortese - Reads/Writes SS/ED 128K Atari disks. Very limited.
8bit/Diskutils/mule.arc - includes Atari Mule; Action!, Turbo C
sources 8bit/Diskutils/mule.exe - IBM Mule
8bit/Diskutils/mule.txt - descriptive blurb

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks. Filename:
8bit/Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Quite
popular. 8bit/Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and
ataridsk.arc)

(Sorry for sqrewing formatting--this does word wraps when I cut and paste.)

I solved this by using those joysticks that had suction cups on the bot-
tom. I used the first stick as always, but stuck the second one to the
floor, took my shoe off, and hit the second-stick trigger with my BIG
TOE... Worked pretty well and made Spy Hunter into a very playable ONE-
player game! :-)

I'm assuming from whats been said that the atari 1050 drive is not 180K? I seem to remember some kind of "extra (double?) density" that the atari 1050 would get, but no other drives would read, or something stupid about it. Does this help me at all? I guess if someone would be as kind as put mule on a atari ss/sd disk for me and mail it to me that would solve my question. Help me!! I have an extensive library of 8-bit software, maybe we could work something out.

As far as I know, you can run it on the Atari and C-64 for sure. There
may have been an Apple II version. There almost certainly was not a Mac
version. It came out ~10 years ago & despite being an 8-bit cult classic,
there just wasn't any demand for it. I could go back to some old
magazines & find out the company which made it.... Then, we could write &
express demand... Then, we could storm the White House.... Oops -- went
off dreaming again...

>1050 would get, but no other drives would read, or something stupid about
>it.

Standard Atari 810 single density drives were 88K. Many third-party drives were true double density: Percom, Indus GT, Rana 2000, etc. A company called Astra even maketed a 360K double-sided, double-density, two-drives-in-one-case monstrosity. It was great!

When Atari introduced the 1050, it produced a "density-and-a-half" standard that came out to 127K. The only way to rectify incompatibility problems that I found was OSS 4.0s command-driven DOS, a pretty nifty OS for any time, much less 1984. OSS was very flexible & would let a true double-density drive (I had a Percom, an Indus, and 2 810s) read the 1050s bastard format. Still no way for a 1050 to read true double density, though.

Why did Atari do this? Beats the hell out of me.

>Does this help me at all? I guess if someone would be as kind as
>put mule on a atari ss/sd disk for me and mail it to me that would solve
>my question.

MULE was (and still is) a copyrighted game. I'm not a moralizer; I just think the rules here forbid transactions of that sort....

Thanks for your post on the CSS burner Ben. I probably could have accepted a fixed unit as being reliable, except that when my unit was sent in and repaired/tweaked by Bob, I still had problems. The other trouble is that for some reason, I have had a terrible time with blown PALs on the cartridge board. I think I have gone through 6-8 PALs or so. Sigh...

At this point, I'm afraid I'll have a hard time trusting it unless Bob finds something he was not doing correctly in the burning algorithm, and manages to fix it.

There was an IBM PCjr version... as a ROM cartridge! Good luck
getting it to run on modern PCs.

Here's a gripe. Imagic gave us Demon Attack for the 2600. Then
they made an Intellivision version with enhanced graphics and a
Phoenix-like stage.

The version for the 400/800 was a direct port of the 2600. The
IBM PCjr cart was based on Intellivision.

I'm sure you could count those carts on one hand.

3901. What to do with old Ataris?

Newsgroup: comp.sys.atari.8bit
Date: 1993-10-13 06:33:33 UTC
From: ulrich@world.std.com
Message-ID: <CEtovy.Gw3@world.std.com>
Source record: 104610

Hi,

This is probably a FAQ, but can someone suggest a socially responsible way to dispose of two Atari 800 (48K) systems? Both have Percom disk drives, plus miscellaneous hardware and software between them (e.g. Ape-Face parallel printer adapter, lots of games). I've also got two letter quality printers, one Comrex daisywheel and the other a NEC Spinwriter. Does anybody want this stuff? I'd be happy to let it go for the cost of shipping. Or are there worthy organizations to donate to... I seem to remember hearing about an org that sends old equipment to Eastern Europe...

Thanks,
Thatcher ulrich@world.std.com

Friday's Player isn't PD, that's true. It's SHAREWARE. Friday wants 10DM
for it. I know it, because I've bought it directly from Friday on the
fair in Hanau. It came with a flyer where Friday explicitely states that
"Fampy" is shareware and may be only distributed along with the describtion.

I guess before I can upload it to the archive I'll have to include the
text on the flyer, and, because it's in German, it should be translated as well.

3903. Assembler 130XE+ on the archive

Newsgroup: comp.sys.atari.8bit
Date: 1993-10-13 09:00:24 UTC
From: uj1g@rzstud1.rz.uni-karlsruhe.de
Message-ID: <29gg38$1ip@nz12.rz.uni-karlsruhe.de>
Source record: 104615

Like promised before, I've uploaded Torsten Karwoth's "Assembler 130XE+"
to the archive at umich.edu

It's been moved to the main atari/8bit directory.

ass130.txt is a short blurb
ass130a.dcm is the main installation/program disk
ass130b.dcm is the documentation in German

You'll probably need the docs even if you don't know German. There're
some parts in it you'll be able to figure out anyway.
Time permitting, I'll try to translate the docs into English later this year.

In the meantime I've played with the assembler a bit. In general I think
it's worth the 20DM (?) shareware fee, despite some minor aspects I didn't
like.

To pick up an earlier thread by Mr. Harris, the assembler uses quite a bit
of RAM under the OS, so it definitely won't work with SpartDOS.
But despite this, the assembler provides its own MyDOS modification.
Within the shell it provides, you can type commands like DIR or LIST
or whatever. What I liked is the ability to create your own commands by
putting your own utilities into a special directory and giving them a
special filename extension.

The program first tries to execute an internal command, then it looks for
it in the ramdisk and finally on external drives. Works pretty well.

A word on the editor. It's quite nice, although, like the docs say, not
suitable for wordprocessing. The editor has been especially designed
to meet assembler source code criteria.

What I liked about it are the block commands. You can highlight a portion
of text and then do with it whatever you want: copy, delete etc.

In order to get to the icon (command) line you'll have to press SHIFT-ESC
(or was it CNTRL-ESC? or just ESC? anyway, something with ESC).

Then just pick up the symbol of the desired command with the cursor keys
and press RETURN.

You can save/load ascii text, save/load assembler sources, print, kill
and more.

This save/load assembler source option is implemented because the
editor automaticaly converts assembler commands into tokens and
thus does syntax checking every time you type a line.

I hope you'll be able to figure out how it works.

There was a hardware upgrade for the 1050 called U.S. Doubler that
would make the 1050 capable of true double density.
Best Electronics still lists the Doubler.

Yes, the two chips are 6821s. However, we (I mean CSS) never had
a problem with certain chips not working properly. You probably just
had a bad 6821. Even though the chips CSS uses are new, you
occasionally get a bad one.

>I advised Bob that I thought he should provide known good standard test ROMs

EPROMs cost money. Supplying 3 test ROMS would cost about $12, which
would be happily passed on to the customer.

>Intel & Hitachi ROMs seem the best to me. Not sure about TI, sometimes those
>are flaky. I don't even bother with Mitsubishi any more.

All used EPROMs fail eventually if you erase them enough times. For
important uses, buy new EPROMs. Do NOT buy CMOS EPROMs, as they tend to
be flaky.

>There was one more complaint I lodged with CSS about the Burner, which I doubt

>determine performance relative to an external standard. It just seems to me
>that any burner should have enough "smarts" to know when there is, or is not, a
>ROM in the socket. Sheesh.

If you want Bob to add something like that in, expect a $50 price
increase. You have to remember that keeping prices low is the primary
concern at CSS. How many 8-bitters will pay $400 for an EPROM burner?

FYI: I speak of CSS in the past tense, as I no longer work for them.

UTIL does, indeed write disks that are directly readable by
the 1050. Nothing special is needed at all on the 1050 end.. You can
even format the floppy on the 1050, and then use util to copy files
over to it...

> I've been using UTIL on my 1.2Meg drive back and forth with my
> INDUS GT with no problems at all.

The trick to success moving disks between 360K drives and 1.2M drives (besides having the right software, of course :-)) is to understand that the 1.2M drives write narrower magnetic tracks. For example, if you format a disk on a 360K drive and write data on it, then later rewrite the same disk on a 1.2M drive (even in 360K mode), the outer portions of the tracks will still contain some magnetization from the original format/write. This can cause problems when trying to read later, since the signal-to-noise ratio may be reduced below tolerable limits.

So, always mark your disks as being for use in 360K drives or 1.2M drives, BEFORE FORMATTING virgin disks. Then, NEVER format or write using a drive of the other type. You should then have better success READing on either type of drive.

3920. Emulation of the ATARI 8-Bit

Newsgroup: comp.sys.atari.8bit
Date: 1993-10-13 23:03:48 UTC
From: freddy@toppoint.de
Message-ID: <29i1gk$ilq@worf.toppoint.de>
Source record: 104629

I just checked my mail and found an interesting article about the emulation
of the ATARI 8-Bit on the PC. Well, of course it is possible to do that !
It might be interesting for you to hear that I have the complete source-code
for the emulation of the 6502 processor on the PC (Assembler !). However,
it will be a tough task to emulate ANTIC, POKEY on a PC, but it is not
impossible. I mean, who needs sound anyway ? Who needs soft-scrolling ?
The main thing is that there is an 8-Bit emulator to keep this system alive
!
Me and a friend of mine have lots of ideas how you could emulate most of the
special things (DLI etc.). Now, if you are interested in the source-code or
if you want to design an emulator - send me a message !

freddy@frederik.tpki.de

It is about time for the ATARI 8-Bit to conquer a new world, dudes !

Have a good day !

I wouldn't say every, but a good number of them, yeah. B-) Man, ARCHON, PINBALL CONSTRUCTION SET, M.U.L.E. ... Let's face it, EA couldn't have done some of their early smashes without the Atari 8-bit to work with (Not true for PCS, but most of the early EA games were optimized for the Ataris).

I used to buy EA software sight unseen on their reputation alone, but eventually quality slipped. ARCHON II was so-so, for instance, and RACING DESTRUCTION SET was just terrible. And I know a lot of Atari owners who are still mad at Trip Hawkins for having Electronic Arts get _really_ intimate with the Commodore Amiga, at the expense of the (then) budding Atari ST market.

The problem is, the CMOS EPROMs, and used EPROMS, that failed in the CSS
burner, worked just fine in an RS-232 burner and are still working fine in
the field.

Atari is definately not producing any more 8 bit products. They sold the
Taiwan facility that was making them sometime in 1992 I believe. It's been
leftovers since then.

If you have a virgin (i.e. unmodified) 1050, then it can produce
two formats, SS/SD 90K and SS/ED 128k. Something like the US Doubler,
Super Archiver would expand it to 180K DD.

In addition to Marek's explanation, there's one important subject left:

To run the assembler, you need at least 64k of Extra-RAM, this means
a 130XE or a upgraded 800XL/600XL/...

There is a ram bank test and configuration programm supplied.

Bye,

Peter

What about the huge warehouses of back inventories they found around 1990/91? 1450XLD's? 1050's? XF551's? Some REAL "vaporware"... Anyone pick up on any of it? Know who might have? Come on man, we need names! Addresses!

Any info ANYONE has to offer is appreciated! Maybe we can get some actual "NEW" unopened Atari equipment back into the marketplace! Bulk order? I mean BULK... maybe if we can get about 100 of a drive or 50 of some system, who knows... ? ! ?!?? !?! ?!? !? !? ?!?

I wouldn't give EA that much credit. There were many great games released by Synapse (Alleycat), LucasGames (BallBlaster, Rescue on Fractalas), Origin Systems (Ultima series, Ogre, AutoDuel), and a host of other publishers. EA was a large publisher, but not nearly the major source for every good 8bit game.

Hi all,

A question, and a "bug"/trick....

What do you do with the idol... ???

I found in my 32K copy (yes, copy, I'm looking for an original 32K version)... that there seems to be a bug..... anyone have an original for sale ?

If you stand by the door on the upper left (touching it), and jump at the right time, your foot "sticks" in the door, and you can jump up, up, up right into your items box..... !!!! When you do, you can hit an item, and fill up your properties box with that item..... then you jump up, up, up right into the above screen of the maze and can continue from there.....

But, I've never done much beyond the idol... I could not figure out what to do....

Don't know if the bug is limited to my copy or all copies....

Thanks,

-- Curt

From: herb@cup.hp.com
Message-ID: <CEx32q.K5A@cup.hp.com>
Source record: 104643

Timothy S. Pillsbury (tsp@ccd.harris.com) wrote:
: I'm looking for some public domain MIDI software to run on my 130XE,
: but not having any luck at umich:atari/8bit.
: It seems they only have MIDI stuff for the ST.

: Has anyone ever seen MIDI software for the 8-bit?
: How about commercial software?

Yes, commercial software was written. I can't remember the name of the company off the top of my head, but I have it boxed up at home. There is a sequencer that specifically takes into account the extra memory of the 130XE (version 3) and also a predecessor (version 2) that will run on other 64k 8-bits with a few less features. There is also a patch librarian from the same company (specifically for the Yamaha DX7 in this version). I have all three programs and the MIDI interface, as I said boxed up sometime over the last year. I haven't run any of it in several years as I run on another platform.

In fact the last time I did use it, I connected my PC MIDI connection up to it, turned on one of the Carmen SanDiego programs and captured part of the MIDI stream onto the Atari, then brought up the PC sequencer, and reversed the process to get the sequence on the PC for later analysis. Of course, I never did have any time to work on it! ;-)

The 8-bit sequencer by todays standards is rather primitive, though it is still pretty amazing what it packed into an 8-bit program and user interface. It does handle all 16 MIDI channels, and basically had real-time entry from a MIDI keyboard, with primitive to non-existant editing capability. You can do punch-in punch-out recording to fix mistakes, and in the newer version you are supposed to be able to insert MIDI data directly. I've been too busy (lazy ;-)) to get rid of this stuff, and my other 8-bit gear, but I probably should sell it to somebody who can appreciate it, rather than letting the bits go stale ;-)

I have an 850 interface, happy (1050?) drive, one of those sleek black drives whose name also escapes me, versions of Kyan PASCAL, one of those small "C" compilers (Deep Blue C?), and the usual assortment of typical games, mostly public domain,... lets see... some kind of printer interface, and who knows what else.

If you're really dying to have the MIDI software/hardware, I could package it up and send it, though my preference was to go to a local user group meeting and see if anybody was interested. The original cost at "special" prices was on the order of $400 (you read it right), and I have no idea what I should sell it for, but I imagine

it would be a fraction of the original. It would probably be best if I attempted to resurrect the hardware and see if everything still works ok. And, yes I have all the documentation for the software.

>: --
>: Maxwell Smart, Harris Controls : tsp@ccd.harris.com : (407)242-5255

If you have any questions, I can go back and check the documentation whether you're interested in the software or not. Just give me a few days ;-)

Cheers,

Herb

Well, my copy also did this. Another neat thing is if you don't open the doors on the idol screen, you can climb up the ladder and up the door. Once you open the door, you can't climb them. I actually backtracked through the maze all the way to the first electric bridge with electric walls and went the other way for a bit, but I wasn't able to solve it. I always ended up with a red key, but never found the door for it...

:
I had one of these gems. They were manufactured by ICD and plugged into the
PBI of the 800XL or 130XE. The installed ports were one RS232 serial, one
centronics parallel (the same cables as used on the 850), and one SASI/SCSI
port (SASI is the predecessor of SCSI - Shugart Asso. System Interface).
The RAM could be set up as printer buffer and/or ramdisk(s). The MIO also
has it's own power supply, so RAM contents are preserved, even if the
computer is turned off. The MIO could swap drives to any drive number,
which meant it was possible to boot from the MIO.

I set mine up my one meg as a 32K printer buffer and several floppy size
ramdisks (I also had a hard drive, so I didn't need any big ramdisks).
However, I soon got tired of reconfiguring and reloading a meg of RAM
everytime the power glitched, so I replaced the external power supply
with a motorcycle battery & one amp trickle charger. Then I never shut
the MIO off.

I also did cute tricks like keep images of bootable floppies on the hard
drive using DiskComm, and loading them into one of the MIO ramdisks
when I wanted to run them. PaperClip really FLYS when run from a ramdisk.

One last thing about the MIO. Early models had an extra port which was to
become a video port. ICD finally dropped the video because Atari kept
changing the software specifications for the XEP80. I heard rumors that
ICD was going to put in an IBM CGA monitor compatible video port for
80 column color screens.

3941. Re: Writing Atari Disk formats...

Newsgroup: comp.sys.atari.8bit
Date: 1993-10-15 16:01:34 UTC
From: aa700@cleveland.Freenet.Edu
Message-ID: <29mhgu$4ir@usenet.INS.CWRU.Edu>
Source record: 104653

In a previous article, dfwright@sadis05.kelly.af.mil (DARRYL F. WRIGHT - TISTE) says:

> UTIL does, indeed write disks that are directly readable by
>the 1050. Nothing special is needed at all on the 1050 end.. You can
>even format the floppy on the 1050, and then use util to copy files
>over to it...

UTIL works with SS/DD 180K disks, best used with MYDOS.

The Atari 1050's highest density is SS/ED (enhanced density) 128K disks.

Unless your 1050 has been upgraded with something like the ICD U.S.
Doubler to allow it to work with true double density, it can't be used
with UTIL.

>every good 8bit game.

Point taken, although I was making a deliberate overstatement. Lessee....
Alleycat was very unique & highly playable, though it got boring once
you'd beat all the levels. (IMO). Couldn't play Rescue on Fractalas,
since I had an 800.... Ultima IV, in my mind, remains the best computer
RPG ever. I've bought a copy since moving to the IBM. Even U5, U6, U7
don't have the role-playing and ethics aspects of U4.

AutoDuel? Is this a (well, in 8-bit terms, anyway) more recent release?
I've never seen it.

-Andrew

3944. Expanding a 600(!)XL to 320 KB???

Newsgroup: comp.sys.atari.8bit

Hi there!

See subject. The problem is that the ONLY computer I have foung that has +5V on the system bus is a 600XL. My Turbo-Freezer runs PERFECTLY with it (including the old 800 ROMs on it, they tend to make stupid things (crashing etc.) when used with several 800 XLs).

That's funny, I spent many hours playing Rescue on Fractalus on my stock (48K) 800. Great game, if you had a lot of time to spend.

Just as a bit of trivia, does anyone know why the original name of Rescue on Fractalus was Behind Jaggi Lines, and why it was changed? I have a copy of the BJL version.

-John

BTW, Didn't LucasGames also change Ballblazer to Ballblaster? I believe I have a copy of Ballblazer as well as Ballblaster. Same game, as far as I can tell.

My guess would be a marketting decision based on the fact that Fractals
were getting popular around then, and 'jaggi lines' doesn't exactly conjure
up a great mental image of graphics.

John Harris "My satellite went to Mars,

It appears people don't want to pay an advance sub to the new DGS magaaine,
so if you would prefer just to receive the first issue and then decide whether
to take a sub or not, please send
US$5 in cash to us and we will send
you the first issue . Our address and sub details follow.

THE NEW D.G.S MAGAZINE - FULL DETAILS
=====================================

You should all have read on the net that we here at DGS are turning the
News-Disk into a new printed magazine. Last time I didn't have many details
to give you all, but pretty much everything is sorted out now.

Name

The magazine is going to be called "The Atari 8-bit News-Paper". We have
decided to try and keep the name as similar to "News-Disk" as possible so
people will know what it is! We have changed "Disk" to "Paper" because it
is now on paper and not disk!

Issues per year

We feel that we should be able to produce 6 issues of the magazine per year.
We will try and keep to issue deadlines, but there is only me and a couple
of guys who help out now and again so the magazine takes a lot of work to put
together.

Content & Style

The content and style of the magazine will be exactly like the News-Disks.
It will be "light" in style and easy to read. It will cover lots of different
areas including games, hardware, software/hardware reviews, hints, tips,
hardware modifications, new product information, and more! It will also carry
adverts from both UK and US companies. These ads are going to be given free
in the first issue. The magazine is in a very relaxed style and should
hopefully appeal to a wide section of the Atari community. If you have read
and enjoyed the News-Disks then you will like the new magazine!

Subscription Rates

We have kept costs down to a bare minimum in order to bring you the magazine
at a reasonable price. The first issues are going to be printed in A5 format

in order to keep start-up costs as low as possible. Here are the subscription rates. We are initially offering subscriptions on a 4 issues basis (as we did with the News-Disks):

U.K ------------ 6 pounds / 4 issues
Europe ---------- 8 pounds / 4 issues
U.S.A. ---------- 10.50 pounds ($21) / 4 issues
Far East
& Rest Of World - 13 pounds / 4 issues

We are able to accept payment in UK Pounds or US$. The price to the USA is quoted in both pounds and dollars. If you are in the UK then payment should be made by cheque or Postal Order. If you are in Europe or the rest of the world then you should pay in UK Pounds by IMO/Bank Draft or other suitable method (no credit cards - sorry!). If you are in the USA then the easiest way to pay is in US$ in cash. We accept payment in US$, but only if paid in cash. If you wish to pay by IMO instead, the cost in pounds is also given above.

All prices shown INCLUDE shipping by Air Mail.

Issue date

The first issue of the magazine is reaching the end of its production stage. The articles have been collected and edited, and final prints have been done. We now need to finish the cover and drop in the adverts, get the copies down to the printers, and pray! We are hoping to release the issue at AMS 7 in just 6 weeks time! That means that the copies have to be with the printers in err well last week really, but I begged them to hold on for them! If we get them back before the show then you should expect to get the first issue around mid-November time.

We need your help!

In order to make the magazine work properly, we need a minimum of 100 subscribers. We currently have around 30 in the UK, but only 2 in the US. The printers will not consider doing a run of less than 100, so at the moment we are having to do far more than we need to and swallow the cost. All I can do is BEG you to subscribe. $21 isn't too much to pay! Also, please tell all the Atari people you know about the News-Paper, and get them to subscribe also.

Help spread the word - upload this posting to as many BBSs as you can. Tell people we exist, get them to subscribe!!

Our details

Please send your name and address with your subscription directly to:

DGS (SUBS.)
62 THOMSON AVE
BALBY

DONCASTER
DN4 0NU
ENGLAND

Thank you!

Dean Garraghty.

[snip]
I seem to remember about 3 months back that vparada in Chile was looking at ways of making UTIL work on a standard 1050. He seemed to be under the impresion that it was possible by changing some of the options in the source file and recompiling the code. Anybody know if he managed it?

3954. Colors

Newsgroup: comp.sys.atari.8bit
Date: 1993-10-16 12:18:01 UTC
From: uj1g@rzstud1.rz.uni-karlsruhe.de
Message-ID: <29oopp$s4a@nz12.rz.uni-karlsruhe.de>
Source record: 104514

Like you know, the 8-bit can display 128 colors simultanously without too many tricks. I'm not talking here about APAC, PRYZM and other flickering colors, just of the good old DLI effect.

When you want to display a color you just poke a value into the appropriate register.

I can use POKE 710,0 (2,4,6,8,10,12,14) in order to get 8 different shades of GRAY, right? The next color starts at 16, 32, 48 etc.

Now, my question: are these colors arranged in any way, or is it just random? Why do I get some sort of RED starting at 16 and not GREEN or BLUE?

What's the trick here? Can I apply the arrangement of the color wheel in some whay to find out how the colors are arranged on the 8-bit?
Eg. green being the opposite (inverse) color of red. How does it compare to the 8-bit?

Any ideas?

Last night I got the shock of my life, I saw a 130XE and a 1050 drive on
Tommorows World (BBC 1's science and technology programme, similar to
Beyond 2000, only much better :-)). They were doing a report on a computer
club in Moscow, and there next to the PC's was an Atari!
How's about that! Atari Rules O.K.

You can try a different approach than reprogramming the whole MyDos.
What the Klaus Peters' ROM-Disk does is just emulating a disk drive.

The built in piece of software just boots MyDos from the EPROM like from
a disk drive. This is maybe a little bit slower than mapping the
cartridge into the main memory but still as fast as loading from a ramdisk.

It's quite convenient as you can store almost all kinds of software on the
ROM-Disk. Even Torsten Karwoth's Assembler 130XE+ supports it.

When I think of it, yes this should be possible somehow. Actually Atari's
first three boot sectors always are 128 bytes long, even on DD disks.

I think even UTIL formats the first three sectors with 128 bytes length.
Why not make the first 4, 5, 6, all sectors that way?

Another question: does anybody know how long the gap between two
subsequent sectors on an ED Atari disk is? How about the gap on SD disks?
How do one measure this gap? In milliseconds?

I suppose one should know this when trying to create a program capable of
reading and writing Atari disks on the IBM.

3961. EMULATION of the ATARI 8bit on the PC

Newsgroup: comp.sys.atari.8bit
Date: 1993-10-16 17:46:22 UTC
From: freddy@toppoint.de
Message-ID: <29pc1e$3oq@worf.toppoint.de>
Source record: 104522

I just checked my mail and found an interesting article about the emulation
of the ATARI 8-Bit on the PC. Well, of course it is possible to do that !
It might be interesting for you to hear that I have the complete source-code
for the emulation of the 6502 processor on the PC (Assembler !). However,
it will be a tough task to emulate ANTIC, POKEY on a PC, but it is not
impossible. I mean, who needs sound anyway ? Who needs soft-scrolling ?
The main thing is that there is an 8-Bit emulator to keep this system alive
!
Me and a friend of mine have lots of ideas how you could emulate most of the
special things (DLI etc.). Now, if you are interested in the source-code or
if you want to design an emulator - send me a message !

Unfortunately I (Ulf Petersen) do not have my own InterNet account yet.
Please mail to ...
freddy@frederik.tpki.de

It is about time for the ATARI 8-Bit to conquer a new world, dudes !

Have a good day !

======================================================================
PRESS RELEASE -- The CLEVELAND FREE-NET ATARI SIG -- 16-Oct-93
======================================================================
The Cleveland Free-Net Atari SIG announces the immediate availability of
ALL issues of Z*Magazine ever published, from 1986 to the final issue last
year. This is an IMMENSE resource, containing dozens of product reviews,
tutorials, old news items, and the rest of the features that made Z*Mag
such a long running success.

For those who don't know, Z*Magazine was the original Atari online
magazine, and the forerunner of today's STReport and Atari Explorer Online.
Throughout its lifespan, Z*Mag concentrated on the 8-bit 400/800/XL/XE
Atari computer community.

Over 210 issues are available. There is no un-archiving to perform, and
there are no multiple text formats to struggle with. All issues are
presented in a single chronological listing, in UNIX-style ASCII.

In addition to the complete Z*Magazine collection, the Atari SIG's 8-Bit
Computers Support Area features the latest 8-bit news, product summaries
and reviews, tips and tricks, guided access to the Internet's Atari Archive
FTP site, and the last six months of the Info-Atari8 Digest.

Coming soon: the new 8-Bit Technical Forum.

To visit the Cleveland Free-Net, with your modem dial 216-368-3888.
Or, on the Internet TELNET freenet-in-a.cwru.edu (129.22.8.38).

Applications for accounts are handled online, and are free of charge. You
may also browse the Free-Net as a visitor. Once on the system, type "go
atari" to reach the Atari SIG.

Send inquiries to the Atari SIG at: xx004@po.cwru.edu

That's a good question, but another thing to point out is it's not as if
the colors went: red, blue, orange, green or something, they went very
much in order, just sort of starting at a different place, I guess.
Yellow->Red->Purple->Blue->Green (1-15) and then Black/Grey/White is 0.

If you were to do this in BASIC:

```
10 GRAPHICS 11:REM color only mode
15 REM 712 is set to 4 automatically by the GR.11 call
20 FOR Y=0 TO 191
25 C=INT(Y/13)+1:REM starting at color 1, going to 191/13+1=app.15
30 COLOR C
35 PLOT 0,Y:DRAWTO 79,Y:REM draw a line from left to right
40 NEXT Y
45 GOTO 45:REM wait for [BREAK]
```

then you'll get all of the colors on the screen, which even includes
black if you count the borders... but these are all the COLORS. Try
messing with your Hue-knob on your TV or even the potentiometer(sp?!)
inside your Atari to see the colors sorta move up and down. :)

Funfunfun.

And speaking of the color wheel, I had a lot of fun looking at the good
old color wheel on the Mac System 7 color setup screen - and trying to
determine how the colors are spread out to make that nifty thing.

One day soon I'm going to try to make a little BASIC program that draws three screens for ColrView which makes up one of those wheels.

(now where'd I put that paper!?)

Message-ID: <TgaJBc2w165w@cyberden.sf.ca.us>
Source record: 104529

Why is everyone so hot to get ALL of MyDOS onto the EPROM? Personally, I'd kill for just DOS.SYS, and maybe some sort of mini DOS menu which only did a directory list and a load and maybe gave you XIO commands (it wouldn't KNOW them, but you'd say like [X] "32" "BOB.TXT,FRED.TXT" to rename a file).

Ahh fooey. If anyone figures it out, just tell me! :)

And btw tho, ROMdisk DOES sound awesome (NOW that I know what it is! :))

3968. Charactor under the cursor???

Newsgroup: comp.sys.atari.8bit
Date: 1993-10-16 23:17:16 UTC
From: A644690C@vax.edinboro.edu
Message-ID: <01H46W4YOR0I8WWPGE@vax.edinboro.edu>
Source record: 104526

Does anyone know an easy way to read the charactor under ther cursor in
Gr. 0 mode, without having to OPEN a special channel? (In BASIC)
You can't use locate because you get a 'write only' error. I tried poking
values directly into ROWCRS and COLCRS ($54 and $55,56) and then reading
OLDCHAR ($5D) but I don't know how to force OLDCHAR to be updated.
I could probably use OLDADR to find the address of the cursor and then
peek that location, but there should be an easier way. Any suggestions????

Thanks....

-Adam Conover.

3969. New games?

Newsgroup: comp.sys.atari.8bit
Date: 1993-10-16 23:24:31 UTC
From: A644690C@vax.edinboro.edu
Message-ID: <01H46WF7XIQW8WWPGE@vax.edinboro.edu>
Source record: 104527

I was looking through last years B&C catalog a while ago and I noticed several 'new' games that I have never really heard anything about.

Fred
Scary School
Mirax Force
Ninja Commando
Draconos
Donald
Techno Ninja
etc.

I was wondering if anyone had actually played any of these and what they thought.

I am just looking for some decent 'arcade quality' games to help relax between classes.

peace,

-Adam Conover.

I read about these Lucasfilm titles in a 1984 issue of
Electronic Games (same issue featured the forthcoming 7800
system). This was, of course, just before the Tramiel
take-over and both were shelved. Even so, the 7800 versions
were already being worked on.

Anyway, they were already using the names "Rescue on Fratacalus"
and "Ballblazer".I don't think ROF was a marketing decision at
all. It was said to use some sort of fractals for the landscapes
(I'm sure it was pretty basic to get good speed). As they said,
fly past a hill, turn around and see the same hill! The same
system used for Koronis Rift (as a land rover) and The Eiodlon
(a bit more advanced, needed 64K).

"BJL" and "Ballblaster" were betas of some sort; apparently
quite early.

Rrghh.... I'd never bought the game, since I had heard it didn't run on
the "classic models," only XL/XEs. That may earn ROF a unique award as
one of perhaps only a few games for the Atari 800 which I didn't have....

A644690C@vax.edinboro.edu (Adam Conover) writes:
>Mirax Force
>Draconos

I have both of these games. Mirax Force is a basic spaceship-man
flying through outerspace shooting/bombing the parts of different
ships (which is your background) and dodging attacking ships. It has
nice graphics and a bit of digitized voice. (if memory serves me
right).
Draconus has nice graphics as well and is a fun game to play. You're
this Draco-guy who must go around and collect these pieces/tools (4 total)
in order to kill some Tyrant. It has a significant amount of different
rooms and obsticals to overcome. It might take you a while to solve
it. (OH, and about half way through it, you get to turn into this
Draco-Newt to swim through water)
I also have a Draco_Fix, and a Zybex_Fix I programmed eons ago. It
enables you to have unlimited lives on each game. I have solved both
games the first time I sat down to play them w/o the cheat. But
others wanted these fixes so I programmed them. If I can find my old
pirate source disks then i'll send these fixes up to the archive.

Speaking of games: Has anyone SOLVED, "Universal Hero" ?
I could only get so far and then nothing. Think each time
the game locked/spazzed at the security disk part. Any help
is greatly appreciated.

>disks I've written CERTAINLY DO NOT have SD sectors for boot...

Uhm, I think that the situation is that most programmers don't want to
have to have different boot code for different disk formats, so only
the first 128 bytes of the first 3 sectors are used on any standard
dos format disk. Now I've heard it said quite often that the first 3
sectors are single density even if everything else is double density,
but I doubt that that is truely the case. More likely, the extra
space is just ignored.

Does someone with a sector editor and a double-density drive care to
check on this? Just read in the first sector of a standard dos
formatted double-density boot disk and modify bytes 129-255. If it
still boots and subsequent reads verify that the data was actually
written, then my suspicions are correct. If not, then that would be
truely interesting.

I've played Mirax Force and Ninja Commando, and they are both great!
Mirax Force was originaly released by Tynesoft (I think), and then re-released by Zeppelin Games. Fred, Ninja Commando, Draconus and Blinky's Scary School were also released by Zeppelin. I haven't played all of them, but Zeppelin have a very good reputation so I wouldn't hesitate to recomend any of their games. They produced some of the best games ever written for the Atari in the UK, and they are arguably up there with the best along with LucasFilm and EA, IMHO.
BTW, the cheat mode on Mirax Force is activated by typing CPM on the title screen.

3980. PC enslavement?

Newsgroup: comp.sys.atari.8bit
Date: 1993-10-17 17:01:30 UTC
From: evans@cs.washington.edu
Message-ID: <1993Oct17.170130.4614@beaver.cs.washington.edu>
Source record: 104541

I am considering beginning work on a software/hardware package
that would allow an 8 bit Atari to access an archive of files stored on a PC,
via a RS232-SIO port interface. I know something similar was done before, but
I hope to create a package that is much more convenient for handling and
selecting the files from the archive. Three questions!

1. How many people would be interested? The software would be free, of
course, and I would sell the little hardware hack job for cost, ~ $10, or
send plans.

2. Does anyone know the whereabouts of the author of the SIO2PC package?
I would like to ask his opinion about this, as the hardware portion
of my idea is uh.. suspiciously similar to his plans.

The software would be a driver for the atari end that would
install an F: device to mirror the archive directory tree stored
on the PC. It would be readable/writeable via MYDOS. It would also offer
virutal boot disk emulation (like SIO2PC), except selectable from the Atari
end.

All in all, basically making that new DX66 you have into a $3000
smart hard drive for your 8bit. (There is something just... _right_ about
that, isn't there? :) The PC end would be able to run as a background icon on
a windows system, without crippling the system *too* badly.. :) (Gotta love
windows "multitasking", don'cha?)

3. Has this been done already?

Thanks
*
Jim Evans of the U of Washington Nuclear Physics Lab

3981. Atari 2600 games and hardware for sale

Newsgroup: comp.sys.atari.8bit
Date: 1993-10-17 19:10:11 UTC
From: cohen@GOMEZ.phys.virginia.edu
Message-ID: <00974288.2CB42CE0@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 104543
Cross-posted to: misc.forsale,comp.sys.atari.8bit

For sale Atari 2600 items-

Please send offers on individual items or on the complete package, either way is fine.

I'll sell to best reasonable offer, hopefully within a couple of days. Very good offers will be accepted without delay, though!

Please send correspondence to COHEN@GOMEZ.PHYS.VIRGINIA.EDU or call (804) 293-8973 in case you do not have an e-mail account.
Thanks for the interest!

Atari 2600 system and items for sale:

Atari 2600 complete unit- original style:
in excellent condition, with all cables, TV/GAME switch box, and (if you need one) a 300 ohm-->75 ohm adapter (allows hooking to the cable-ready connector (75 ohm) on newer TV's that do not have the 300 ohm antena connectors found in older TV sets), and a 75 ohm-->300 ohm adapter (allows a direct connection of cable to the "TV in" port on the switch box, as nowadays vitrually nobody uses the 300 ohm antena cables that the switch box is built for). (The above adapters can be readily purchased from TV shops and from Radio Shack and electronics suppliers, I mention them just to let you know that in case you need them, I can supply them...)

Atari 2600 unit- jr. style-
This is the newer model, which is MUCH smaller, and looks similar to the 7800 design. This is also a complete unit with all parts.

VID-TARI:
A black hard plastic protective hood that goes on top of the Atari 2600, with a place to put the cartridges and manuals on the top of it; it also allows joysticks and power supply cable to be connected, so the whole system can be conveniently operated with it

Atari joysticks

Higher quality game joysticks (various types).

Atari paddles

A series of Atari catalogs from different dates.

A storage box for 24 cartridges (Atari 2600/5200/7800) or cassettes or even 8-track casettes if the need arises. Wooden base, smoked clear hard-plastic top, blue velvet-like inside.

CARTRIDGES-

GunSlinger/Target Shoot
Pele's Soccer
Joust
Raiders of the Lost Arc (Lucasfilm/Atari)
Space Jokey (Vidtec)
Chase
Jr. Pac Man
M.A.D. (US Games)
Pac-Man
Berzerk
Boxing (Activision)
Home Run
Video Pinball
Astroblast
Outlaw
Star Wars- The Empire Strikes Back (Lucasfilm/Parker Brothers)
Super Challenge Baseball
Grand Prix
RealSports Volleyball
Donkey Kong
Fishing derby
Yar's Revenge
Breakout
Indy 500
Astroids
Activision Freeway
Skiing
Target Fun 27 TeleGames
Activision Kaboom!
Activision Kung-Fu Master
20th Century Fox M*A*S*H
Laser Blast (Activision)
Star Master (Activision
Apollo Final Approach
BurgerTime (Data East)
Astroblast (Mattel)
Space Attack (Mattel)
Football
Night Driver
Championship Soccer
SwordQuest-EarthWorld
Basketball
Midnight Magic (Borderbund/atari)
Video Olympics
Space Invaders
Adventures of Tron (Disney)
Circus Atari
Air-Sea Battle
Defender

Combat

Book for sale-
Hirschfeld- How to Master the Video Games (30 most popular games, includes "Hottest Tips on Pac-Man")

Please send correspondence to COHEN@GOMEZ.PHYS.VIRGINIA.EDU or call (804) 293-8973 in case you do not have an e-mail account.
Thanks for the interest!

Out of all of my experience, all of my DD disks still have the first
3 sectors in single density. I have written DD disks, and then read
the first 3 sectors on an unmodified 1050 and it reads them in. So it
must be single density. I also tried to read the other sectors and it
barfs out. I have also tried to access bytes 128-255 (0-127 single
density) on my DD drive, and its a no-go. This is typical behavior of
Sparta Dos 2.x+, SDX, MyDos, and Dos_Xl. I have used these on a
US Doubler 1050, Indus GT, Percom, and XF551.

So whoever said their boot_disk has 256 Byte Boot_Sectors, what sort
of DOS/Booting Program were you using?

My question is: WHY make it a new device handler? It only makes using
your software harder to modify to access all of your files on the pc
end. And for programs you dont have source to, it makes it hard for
normal users to change. Whereas, most programs already support the D:
device. IE: Why make it have special handling conditions on the 8bit
side? I fail to see the point of making it a new device.

>Thanks....
>
>-Adam Conover.
> a644690c@edinboro.edu

Actually, you can use the LOCATE command, but you have to open a special
channel to "E:" (I believe you would use OPEN #IOCB,12,0,"E:" (or perhaps
13 instead of 12), and/or use a GRAPHICS 0 statement in your program
(I forget which combination works and don't have a manual in front of me).
One method of obtaining the character is to use ROWCRS and COLCRS and
then PEEK directly into screen memory. The screen is 40 columns across,
so:

```
CHARACTER_UNDER_CURSOR=PEEK(88)+PEEK(89)*256 + PEEK(COLCRS) + PEEK(ROWCRS)*40
```

[I don't have Mapping in front of me, so you must look up ROWCRS and COLCRS]
where PEEK(88)+PEEK(89)*256 is the beginning of screen RAM. Note that
standard Atari BASIC doesn't support the underscore character in variable
names (BASIC XL and XE do, though), so change the name of the above
variable. Finally, this value doesn't correspond to an ATASCII value; it
is the internal representation of the character. There is an operating
system call to convert between the two (there has to be, or LOCATE would
never be able to work in GRAPHICS 0).

This is a post for a friend without Usenet access. Pleaes send replies
to HIM at Bryedewaard@delphi.com. Thanks!

For Sale:

Atari 130XE and 1050 disk drive. Both work fine and are in great shape.
The 1050 he says, though, has a slight physical flaw (don't ask me, ask him, I
don't know what it is, but it DOES work).

Both for $75 plus shipping.

Again, if interested, send mail to Bryedewaard@delphi.com. Please don't send
it to me. Thanks!

I don't think there was. The sequel to the Boulder Dash series (I, II, Super, and Construction) was named Rockford. The graphics changed a bit, but gameplay was the same. It was released for the Atari ST and PC.

But this was the bad-old-days (5-6 years ago). Reviews said it was CGA, and sound boards were non-existant then.

Various PD versions have been released, none all that special (one used VGA and you could see the whole cave at once, one way to deal with high-speed scrolling!).

FYI, there is a program floating around containing music from some Atari 8-bit games. What format you ask? None. Someone yanked the code for music from the originals and stuck a menu on it. (it's an 8-bit executable)

"Behind Jaggi Lines" lasted past the beta stage. There were full and
complete versions that were still called "BJL", and I'm pretty sure they
were marketed under that name for awhile.

I recently bought a used copy of Phantasie II on the net.
There seems to be a problem with disk 4 (side 2 of the 2ndfloppy)

A directory gives 0 free sectors, which means like 300 sectors are
missing. Some of the names of the dungeons are garbled. I can't
save dungeon positions to the disk, because it says the disk is full.
MyDOS's VTOCFIXER says there should be at least 300 sectors free, which
are currently marked as used. I'm doubting that SSI hid a 2nd directory
with other files in it. I played Phantasie I, and I never ran into that
on those disks. I'm guessing "magnetic Rot" or whatever has degraded the
disk, and I need a new, working copy. Does ANYONE out there have a good
copy of the Phantasie II disks? PLEASE! My characters are now 10th level,
and I'm ready to enter the Netherworld. I really want to continue the game,
(don't ask me how I got this far with the damaged disk).. I can't continue
without a good copy. Nothing from my bad of tricks is working.

> ...DD disks have the first 3 sectors in single density...

When the OS goes to read the disk on bootup, it's trying to read 128 byte sectors. The drive has got to return just 128 bytes for things to work correctly. This could be done in the drive's firmware though. The first track might be formatted entirely with DD sectors, but the I/O code in the drive is configured to only read/write 128 bytes of the first three sectors.

You'd have to do a track dump of a DD disk to actually find out whether it had 256 or 128 byte sectors actually mapped out.

jjmcwill@mathlab.mtu.edu writes:
>I recently bought a used copy of Phantasie II on the net.
>There seems to be a problem with disk 4 (side 2 of the 2ndfloppy)

I too have had this problem. I tried copying the files over to a new
disk but the game merely crashes at certain points then. A couple of
years latter I looked into this, and this is due to the game using
the dread *imho* note/point scheme with absolute sector numbers and
byte offsets into each sector. This is used on the monsters/items
code to display the graphic data and get the general info on them.
I do not know if some of those reserved sectors hold the monster/items
info. Im hopeing it doesnt, as it would seem rather silly to use low
level sector reads. I have not looked into the game this detailed
though.
ALSO: if you do get a copy of the 4th disk, could you somehow set me
up with one?

I Have only been able to save 1 dungeon at a time. I used to have a
copy of the 4th disk untouched, and then another disk which held each
dungeon fully solved which I would transfer to the 4th disk when I
needed it or didnt want to redo the entire dungeon.
I beleive my characters are 15th level, and need only 2 more Beast
Runes but its been at least 4 years since I played the game, that they
might as well be level 1s. [although I have meet Pluto and killed him
which I thought was humorous as my characters were only level 13 at
the time, but it gave of them enough exp to get up a level. :)]
[Correction: I need beast Runes, VII the wyvern, and VIII dragon demon,
and then meet up with Beast IX The Ice Dragon.]

< stuff about device handler deleted >

Using the default D: handler on the atari, and still trying to maintain the
flexability of having all your files exist as normal PC files on your PC's
hard drive would be a hell of a challenge. The idea was to get by with
a either a front end or a minimal device driver on the 8bit that would
give you access directly to the PCs hard drive files. Just seems like
it would be alot easier than having to switch vitual disk files on your PC
while hunting for a file.
To have the PC fabricate a phony disk structure for the 8bit, containing all
of the PCs files in a given directory.. Hmm. Not really a bad idea now that I
think of it... Hmm.. ?? Who knows...

Yes it is available for the 2600 as an unfinished prototype that you can not kill Sinistar (DAMN!)

and I think someone said it was available for the SNES or SEGA but not called Sinistar but something else but in the game if you pressed certain codes then Sinistar would come out and play.

> Any and all info you can provide on this is appreciated! For sale?
>Single user doing this as a hobby? etc.???
>

The ROM-Disk is indeed an old development already. The first revisions came
around 1989 or even before that. It's been designed by Ralf David and then
after a while distributed by Klaus Peters.

The ROM-Disk is a commercial product, you get a decent industry standard
PCB.

The ROM-Disk connects to the PBI on the 600XL/800XL computers or to the
cartridge port/ECI on the 130XE/800XE. The ROM-Disk can hold up to 512K
of (E)PROMs where you can store your MyDos, TB XL, games etc.
As it emulates a disk drive most of the software should run on it.

I don't remember exactly how much it costs, it's anywhere from 140DM to
170 DM (around $100).

I don't have one by myself, but know of people who use it.
You can get the ROM-Disk from:

Klaus Peters
Moltkestrasse 29
D-W-5620 Velbert 1
Germany
tel: (0)2051/84815 or 84410
FAX: (0)2051/85784
Developer: Megaram (1MB), 25K Bibomon, ROM-Disk XL/XE, Burner XL/XE,
Speedy 1050, Disk Drive F2000, Sprint XL, Sound-Monitor

(extracted from the Vendors & Developers list posted here around every 15th)

Klaus Peters is one of the big 8-bit suppliers here in Germany, maybe like
CSS in the US.

I talked to them on the fair in Halle and they told me that they may be
interested in distributing their products in the US. They'd need a partner
though who'd provide the necessary custumer support for them in the states.

I can dig out some ads about the ROM-Disk and tell you more later.

Maybe someone else from Germany who owns it could explain it a little bit more?

Also don't miss the October issue of AC! Even if you won't find exactly more info about the ROM-Disk in particular, but it should be mentioned there along with Klaus Peters.

Very interesting! I've tripple checked it and there's no way to read bytes
129-256 out of the first three sectors on my DD disks. I couldn't do
it with ANY disk editor I have.

What kind of a drive/DOS are you using?

On my "Turbo 1050" upgraded 1050 both my own DD disks and those formatted
with UTIL have the first three sectors formatted in single density.
There's no doubt about it!

In article <93479@cup.portal.com>,
John D Harris <jharris@cup.portal.com> wrote:
>You'd have to do a track dump of a DD disk to actually find out whether it
>had 256 or 128 byte sectors actually mapped out.

I've looked at the portion of source code that came with UTIL a while ago.
I found out that UTIL indeed formats the first 3 sectors with 128 bytes/sector.

Funny, now that I've looked once more can't find it again.
Anyway, the following part of UTIL.C shows at least that it reads the
first 3 sectors as 128 bytes long ones.

```
----------
fetchboot(file, drive)
char *file;
int drive;
{
FILE *outf;

aread(1, drive, dosbuf);
aread(2, drive, dosbuf+0x80);
aread(3, drive, dosbuf+0x100);

restfb(save);
outf = fopen(file, "wb");
fwrite (dosbuf, 1, 0x180, outf);
fclose(outf);
exit(0);
}
----------
```

aread(1, drive, dosbuf) reads the first sector of the Atari disk into the
buffer, then "aread(2, drive, dosbuf+0x80)" apparently puts the second
sector at position 128 in the buffer.

Well, this doesn't show that the first 3 sectors are 128 bytes long physically
but it's at least an indication for it.

BTW: The newer version of UTIL seems to have a command not listed in the
menue. /F apparently lets you "Fetch" the atari boot sectors.
It's listed in the source code, but haven't tried it yet.

I havent done this yet since I havent worked on my MyDOS shell ;) in a
while, but look at the DOS thing for Action! that recvs. params from
Sparta.

Personally, I'm using a bit of space in page 4, cuz, well, nobody really
uses it ;)

From: RG9@VAX.YORK.AC.UK
Message-ID: <9311011103.AA14822@deepthought.cs.utexas.edu>
Source record: 104465

One more message about my Yorky 256k upgrades.

After discussions with the designer we have come to the conclusion that ot
(or maybe even it!) will be too expensive to make a new version to work
with 130XEs or be upgraded to 1MEG etc.
So I'm afraid the specs will stay as they are:

Works with 800XL or 64K 600XL
Provides 256k of XE compatible memory
Plugs into PBI port

Still even at that its a pretty classy piece of kit especially for those
who aren't sure which end of a soldering iron to hold.

If anybody is interested I can be contacted at:

>Does ANYONE have a copy of a game named "Ghost Encounters?"
>It was released by the shortlived JV Software company, and

While talking about JV Software, does anyone remember the game
"Journey to the Planets" that was also published by them (I think)?
In this game you had to fly to seven or eight different planets and
collect some sort of treasure by solving puzzles...I would put it in the
genre of action adventure.

I solved all the puzzles but one...there was one planet with one room
where two blocks moved on the top of the screen, and you could change the
color of the blocks by shooting at them, and in another room something
fell down depending on the color of the blocks...I never found out how to
get across the water in one of the rooms...can anybody help me?

Greetings,
Achim

Along the lines of cased/uncased main-memory RAM cards for the 800...
Hand-in-hand with the cased/uncased memory configuration, went at least two
different styles of closure for the removable top panel of the 800 which
covered the memory card bay. The earlier systems, sold with minimal RAM, with
the expectation that the user himself could/would buy and install additional
RAM cards, latched that top panel with a pair of L-shaped plastic catches
which easily "swung aside" to release the panel. Later 800s, after memory
became cheap, were sold fully populated. There was thus no more need for
easy access to the RAM card bay, and so these later models omit the plastic
latches and close that top panel with ordinary screws and wide (metal) wash-
ers which require a little more work to remove to release the panel.

I mention this in case some of you youngsters have never seen the plastic-
latch style of panel holders... :-)

>the public outcry when their expensive third party software wouldn't
>work on Atari's new DOS 3.0. And the public did not have the option
>of modifying third party software, neither did Atari.

I remember when Atari released DOS 3.0 and the big outcry that ensued
by Atari users. Even though there were utilities on the 3.0 disk to
convert files from 2.0S to 3.0, DOS 3.0 never seemed to catch on.
True, the old 810 drive couldn't read the format, so I assume that the
problem was that most Atari users didn't want to upgrade to the 1050 drive.

However, when Apple released DOS 3.3 which required an EPROM modification
to the floppy disk controller card, most commercial software houses initially
put a boot sector on the floppy disk so that both DOS 3.2 and 3.3 users could
boot from. Eventually, most games were shipped only on DOS 3.3 disks.
(Apple DOS 3.2 used a 13-sector format while DOS 3.3 used a 16-sector format).

My Atari 3.0 system disks just sit gathering dust.

I remember almost every Atari BBS in the mid-80's was running FoReM in
Cincinnati OH. I remember calling the ones on some other software and
thinking they were rather novel since they had different commands and
formats...

But heck... this was when 1200 baud modems were a dream item... :)

Sam

4012. 8-bit Atari Frequently Asked Questions

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-01 17:19:25 UTC
From: MCURRENT@carleton.edu
Message-ID: <01H4SS97ZACI8WW20W@carleton.edu>
Source record: 104472

```
Atari Archive: 8bit/faq.txt

Welcome to the comp.sys.atari.8bit/Info-Atari8 Digest discussion group!

The 8-bit Atari

Frequently Asked Questions List

Revised 30-Oct-93

Additions/comments/corrections having to do with this FAQ List are
welcomed by its creator and maintainer, Michael Current:
Internet: mcurrent@carleton.edu
UUCP: ...!umn-cs!ccnfld!mcurrent
Cleveland Free-Net: aa700

The 8-bit Atari FAQ List is posted on or about the first of the month to
the comp.sys.atari.8bit/Info-Atari8 Digest discussion group.

What is this FAQ List for?
The 8-bit Atari FAQ List was created to provide answers to many commonly
asked questions found in the comp.sys.atari.8bit/Info-Atari8 Digest discussion
group. At this time the FAQ List is heavily geared toward describing the
various resources for the 8-bit Atari user available, with relatively little
information on the Atari itself.
This is not an "official" FAQ List in that it is not cross-posted to the
moderated newsgroups news.answers and comp.answers. (There's no particular
reason for this, I just haven't taken the time to figure out the process yet.)
Hence no automatic archiving of this FAQ List occurs, though there's usually
a fairly recent copy on the Atari Archive (see below) as the file
8bit/faq.txt.

What is comp.sys.atari.8bit?
comp.sys.atari.8bit is the unmoderated newsgroup serving as the Usenet
side of this discussion group. All postings to comp.sys.atari.8bit
automatically appear in the Internet's Info-Atari8 Digest.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid on
comp.sys.atari.8bit.

Other Atari-related newsgroups:
comp.binaries.atari.st (ST/TT/Falcon software, object code)
comp.sources.atari.st (ST/TT/Falcon software, source code)
comp.sys.atari.advocacy (pros and cons of Atari computers)
comp.sys.atari.st (ST/TT/Falcon)
comp.sys.atari.st.tech (ST/TT/Falcon technical)
comp.sys.palmtops (includes Portfolio)
```

rec.games.video.arcade (includes products by Atari Games)
rec.games.video.misc (includes Lynx, Jaguar)
rec.games.video.classic (includes 2600, 5200, 7800)

What is the Info-Atari8 Digest?
The Info-Atari8 Digest is the unmoderated mail-list serving as the Internet side of this discussion group. All contributions to the Info-Atari8 Digest automatically appear on Usenet's comp.sys.atari.8bit. The Digest is maintained by John Dunning, jrd@stony-brook.scrc.symbolics.com.

To SUBSCRIBE or UNSUBSCRIBE to the Info-Atari8 Digest, send e-mail to info-atari8-request@naucse.cse.nau.edu.
To CONTRIBUTE to the Info-Atari8 Digest, send your posting to comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on Usenet's comp.sys.atari.8bit.
Note that any posting sent to info-atari8@naucse.cse.nau.edu will NOT be cross-posted to the Usenet side. John Dunning would like this fixed, but needs help; if you are an accomplished UNIX programmer please contact him.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid in the Info-Atari8 Digest.

Other Atari-related mail-lists:
The Info-Atari16 Digest (ST/TT/Falcon). Send e-mail to info-atari16-request@naucse.cse.nau.edu.

What is the Atari Archive?
Atari.archive.umich.edu is an Internet site which contains many files for the 8-bit Atari computers, and is part of the University of Michigan/Merit Software Archives. Our 8-bit Atari Archivists are John Dunning, jrd@atari.archive.umich.edu, and Jody Lenn, lenn@atari.archive.umich.edu. The Atari Archive as a whole is maintained by Jeff Weiner, weiner@atari.archive.umich.edu.

How do I DOWNLOAD files from the Atari Archive?
In one of four ways:
1. FTP (Try the one nearest you first)

a) FTP to atari.archive.umich.edu (141.211.165.41) <--United States
User: anonymous
Password: [your e-mail address]
cd atari/8bit

b) FTP to wuarchive.wustl.edu (128.252.135.4) <--United States
User: anonymous
Password: [your e-mail address]
cd mirrors/archive.umich.edu/atari/8bit

c) FTP to src.doc.ic.ac.uk (146.169.2.1) <--Great Britain
User: anonymous
Password: [your e-mail address]
cd computing/systems/atari/umich/8bit

d) FTP to archie.au (139.130.4.6) <--Australia
User: anonymous
Password: [your e-mail address]
cd alex/edu/umich/archive/atari/atari/8bit

e) FTP to info2.rus.uni-stuttgart.de (129.69.8.13) <--Germany
User: anonymous
Password: [your e-mail address]
cd /afs/umich.edu/group/itd/archive/atari/8bit

Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

2. BART - Brode's Archive Retrieval Thang - the Archive's e-mail file server
To learn about using BART to access the Archive, send e-mail to:
atari@atari.archive.umich.edu. The subject of the message doesn't matter, but
let the body of your message be:

help
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes),
try including a line of this form:

path [your e-mail address]

BART automatically uuencodes binary files (so they may be mailed over the
Internet) and splits up large files into parts of about 30K or less.

3. Gopher
The Atari Archive can be accessed in Gopher. If your system has a Gopher
client, try the command "gopher gopher.archive.merit.net 70" to connect
directly to the Merit Gopher server, and choose Merit Software Archives.

4. AFS
If your system has AFS capability, this is the easiest way to access the
Archive. Just cd /afs/umich.edu/group/itd/archive/atari/8bit

How do I UPLOAD files to the Atari Archive?
In one of three ways:
1. FTP
FTP to atari.archive.umich.edu (141.211.165.41)
User: anonymous
Password: [your e-mail address]
cd atari/8bit/New

(No uploads may be made to the Archive's mirror sites.)

Remember to set file type to BINARY when uploading non-text files
(.arc, .com, .dcm, etc.) by FTP. Also, please upload a short .text file
describing what your upload is, so our 8-Bit Archivists will be sure to place
it in an appropriate permanent directory.

Note that the atari/8bit/New directory is "write-only."

2. E-mail
This is a bit slower, but is still very effective.
Simply uuencode the file, (please split it into parts of 60 K or less)
and mail the result to weiner@atari.archive.umich.edu. Please name
the parts in the subject line. This is really helpful as the parts
usually don't arrive in the proper sequence. Also, please include a
message labeled "file transmission," containing a short description of
the file, etc. Shar files are also acceptable, but uuencoded is preferred.
It is especially important to specify that your upload is for the 8-bit
computers, since most of what Jeff receives is for the ST/TT/Falcon.

3. AFS
If your system has AFS capability, this is the easiest way to upload to
the Archive. Just cp the file into
/afs/umich.edu/group/itd/archive/atari/8bit/New

Are there any other 8-bit Atari FTP sites?
Here's another, maintained by Adam Bryant, adb@albert.bu.edu:
FTP to cs.bu.edu (128.197.2.1)
User: anonymous
Password: [your e-mail address]
cd PC/ATARI

Are there any alternatives to BART?
There are two general-purpose FTP mail-servers. These may be used to
retrieve any files available from anonymous FTP sites on the Internet,
including atari.archive.umich.edu.
1) ftpmail@decwrl.dec.com
For information, send a mail message to the above address where the body of
your message says:
help
quit
2) bitftp@pucc.princeton.edu
For information, send a mail message to the above address where the body of
your message says:
help

What is the Cleveland Free-Net Atari SIG?
The Cleveland Free-Net is like a huge public bulletin board system, and
it is the hub system of the NPTN, the National Public Telecomputing Network.
Anyone can access the Cleveland Free-Net via modem at (216) 368-3888. Those
persons with full Internet access can TELNET (this does not mean FTP) to
freenet-in-{a,b,c}.cwru.edu (129.22.8.38). Applications for free accounts are
handled online, or you may browse the system as a visitor. Once logged-in,
type "go atari" to reach the Atari SIG. Those who add their names to the Atari
SIG user directories are automatically members of the official Atari user group
C.A.I.N. - Central Atari Information Network. Send correspondence and press
releases to xx004@cleveland.freenet.edu.

What print magazines support the 8-bit Atari?

Atari Classics (exclusively 8-bit)

What product developers or vendors support the 8-bit Atari?
There are two files available:
1) "All Known World-Wide 8-Bit Atari Vendors and Developers" is part two of the
8-bit Atari FAQ List, and is posted to the comp.sys.atari.8bit/Info-Atari8
Digest discussion group on or about the 15th of the month. There's also
usually a fairly recent copy available on the Atari Archive as the file
8bit/faq2.txt, or you may contact the maintainer at mcurrent@carleton.edu.

2) "The Official **AC** Vendor List" is maintained by Atari Classics magazine's Advertising Editor, Bob Scholar, r.scholar@genie.geis.com. This list focuses on North America, but all sources listed have been personally confirmed by the AC staff.

What's this UUEncoding stuff (.uu, .uue files) all about?
UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. On the Atari Archive:

Uudecode 1.2a by John Sangster - very functional. Archive filenames:
8bit/Archivers/uudecode.bas - just ENTER this into Atari BASIC
8bit/Archivers/uudecode.doc - the User Manual

Yet Another UU-coder by ?John Dunning? - both decoding/encoding. Filename:
8bit/Archivers/yau.arc - contains both yau.com and yaue.com.

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use." Filename:
8bit/Utilities/uue.arc - contains uudecode.com, uuencode.com.

Dumas UU-coder by John Dunning - should work w/BART-style split files. Fname:
8bit/Cc65/dumasuu.arc - contains uud.com, uue.com, CC65 sources.

What is an .arc file?
A file with the extender .arc has been archived in a standard manner that is common in the MS-DOS world. This is done to make the file shorter, so it takes up less space on your disk and it takes less time to transfer between computers. The Atari Archive contains several 8-bit Atari archivers fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended. Filenames:
8bit/Archivers/superarc.arc - both Super Un-Arc and Super Arc
8bit/Archivers/suprarc2.arc - just Super Arc
8bit/Archivers/supunarc.com - an un-arc'd copy of Super Un-Arc
8bit/Archivers/supunarc.uue - uuencoded copy of supunarc.com

Okay, how about a .dcm file?
A .dcm file is a format unique to the 8-bit Atari which is used to convert entire disk images into files. To work with .dcm files you'll need:

Disk Communicator 3.2 by Bob Puff. Archive Filenames:
8bit/dskcom32.arc
8bit/Archivers/diskcomm.arc

Can I read/write 8-bit Atari disks on an IBM-PC?
There are several programs on the atari.archive of this variety. Note that most require a DOS and disk drive on the Atari end capable of the SS/DD 180K format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs are:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
8bit/Diskutils/atario21.arc

Mule by Rick Cortese - Reads/Writes SS/ED 128K Atari disks. Very limited.
8bit/Diskutils/mule.arc - includes Atari Mule; Action!, Turbo C sources

8bit/Diskutils/mule.exe - IBM Mule
8bit/Diskutils/mule.txt - descriptive blurb

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks. Filename:
8bit/Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Quite popular.
8bit/Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

What's the best DOS for the Atari?
This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2D is disk-based; SpartaDOS X is cartridge-based and includes many additional features. While it's hard to argue that SpartaDOS X is not the most advanced DOS available, it is a commercial product that is no longer manufactured. MYDOS, on the other hand, is a shareware product that continues to be improved upon.
It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. MYDOS is available at the atari.archive.

What are the best telecommunications programs available for the 8-bit Atari?
Here are some of the more popular PD/shareware terminal programs available on the Atari Archive:

BobTerm by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Archive filename: 8bit/Telecomm/bterm12.arc

Kermit-65 by John Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Archive filenames:
8bit/Telecomm/k65v37.arc - the latest version
8bit/Telecomm/k65doc.arc - the documentation
8bit/Telecomm/k65src.arc - the source code

OmniCom by CDY
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Archive filename: 8bit/Telecomm/omnicom.arc

VT850 by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: none
Autodial: No
Archive filename: 8bit/Telecomm/vt850b1.arc

What hardware has Atari created in the 8-bit computer line?
Computers:
400 (1979) 8-16K, membrane keyboard, 400/800 OS
800 (1979) 8-48K, two cartridge slots, 400/800 OS
1200XL (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL (1983) 16-64K, BASIC, PBI, XL OS
800XL (1983) 64K, BASIC, PBI, XL OS
800XLF (????) ?????, a U.K. variety...
65XE (1985) same as 800XL minus PBI
130XE (1985) same as 65XE with 128K plus ECI
800XE (1987?)same as 130XE but only 64K. Mostly eastern Europe.
XE Game System (1987) same as 65XE plus Missle Command, detach. keybd.

Peripherals:
410 Program Recorder (Japan and Hong Kong versions)
810 Disk Drive SS/SD 90K with DOS 1 or DOS 2.0S, MPI&Tandon vers.
820 Printer (40 col.)
822 Thermal Printer (40 col.)
825 Printer (80 col.), req. 850
830 Modem (300 baud acoustic, req. 850, with Telelink I)
835 Modem (300 baud, with Telelink II)
850 Interface Module (4 9-pin serial, 1 15-pin parallel ports,
beige & black metal versions)
1010 Program Recorder (Sanyo and Chelco versions)
1020 Printer/Plotter (print/draw in 4 colors)
1025 Printer (7-pin dot matrix, 80 col.)
1027 Printer (80 col., letter quality)
1029 Printer (7- or 9-pin??? dot matrix)
1030 Modem (300 baud, with 1030 Express!)
1050 Disk Drive (SS/ED 128K with DOS 3 or DOS 2.5)
XC12 Program Recorder
XM301 Modem (300 baud, with XE Term)
XMM801 Printer (80 col.)
XDM121 Printer (80 col., letter quality)
XF551 Disk Drive (DS/DD 360K with DOS XE)
XEP80 Interface Module(80 col. video display and DB25 parallel port)
SX212 Modem (1200 baud, rarely with SX-Express! package)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 2 x SS/DD 180K with DOS 2.0D
1064 64K RAM module for 600XL
1090 XL Expansion System, for PBI, CP/M/MS-DOS/Apple II compatible
XM128 12" green monitor w/ built-in 80-column card
XC1411 composite 14" color monitor
XF521 5.25" floppy drive - 1050 compatible, in XE style
XTM201 non-impact printer
XTC201 non-impact color printer

Where is my nearest 8-bit Atari BBS?

I would highly recommend this cartridge for anyone who doesn't have this game. It's one of the games I never tire of on my 8-bit (along with Mr. Do!, Spelunker, Boulder Dash and a few select others).

4015. Atari software/hardware items forsale - LIST AVAILABLE

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-01 19:57:34 UTC
From: dh395@cleveland.Freenet.Edu
Message-ID: <2b3pne$2dj@usenet.INS.CWRU.Edu>
Source record: 104474

I have many atari Hardware/Software items (and others) to get rid of,
instead of posting it here, you can request my list by sending me e-mail.

If you would like a copy of my list (prices all listed) please send e-mail to
me at the above address (dh395@cleveland.freenet.edu), also note if you
would like to receive copys of it in the future when i change prices
or add items.

Listed are: 066 Hardware Itmes (Videogame & Computer)

111 Atari 2600 Carts
063 Intellivision I/II Items
***** 059 Atari 8 Bit Disk/Cart/Tapes
045 Books
021 Vic 20 Carts/Tapes
019 5200 Carts
017 PC Software Titles
006 7800 Carts
006 Odyessey 2 Carts
005 Colecovision/ADAM Carts
005 Turbo Grafx 16 Cards
004 Bally Carts
003 Sega Master System (I/II) Carts
002 Telstar Arcade Carts
002 Timex Sinclair Tapes
002 Ti99/4a Carts
002 NES Carts
001 Super NES Carts
001 C64 Softs (Disk)

Packages 001 Timex Sinclair Packages
001 Bally Computer Packages

Please reply via e-mail if you would like my list! :)

Thanks

Steve

(p.s. If youve gotten my list before, request it again, ive lowered many
prices)

|> Last Spring I downloaded the GIF viewer from the archive. I just
|> wanted to know a couple of things. Was I doing something wrong or did
|> the COLORS.GIF that came with look terrible when it was loaded? I

If you're talking about my APACVIEW, yes, the color names are practically unreadable. Check out my latest (apacvw24.arc), which has its own, smaller COLORS.GIF file (no color names). If you're talking about Don Davis's atview8, I can offer no apologies.

|> couldn't read the color names on the picture, but I do believe the
|> colors were pretty accurate. I am not trying to start an in depth
|> discussion, but can someone explain (simply) how the GIF's are viewed
|> on the Atari? I know that many of these GIF's use interlacing to

My program decodes them to APAC mode, which is a 256-color trick using graphics 9 and 11. Don Davis's atview8 decodes them to gr.15 four-color mode. APAC looks best when it works, but it only works on certain monitors.

|> create these pictures. If I am correct, interlacing is taking 3
|> different layers of pixels, and overlaying to get the desired result.

Interlacing is where four passes are made over the image, the first two laying down every eighth line, the third pass lays down every fourth line, and the last pass lays down every second line. This lets you gradually reveal the picture, allowing a quick view before loading the entire image.

|> Can the 8-bit display all 3 layers? If so, does this mean that those
|> cool Cindy Crawford GIF's will look great on my 8-bit.

Yes, the 8-bit can display interlaced GIFs. And, case by case, "those cool Cindy Crawford GIF's" will look great on your 8-bit. APAC mode works great on some GIFs, and passable on others. For the best possible color rendition on your 8-bit, convert these GIFs to COLRVIEW mode, and view them with my colrvw26.arc (I only see colrvw25.arc in the archive?). Read the docs in APACVIEW to see how - 4096 simulated colors at 80 x 192 resolution, or 64 simulated colors at 160 x 192 resolution.

Read about these programs in Atari Classic magazine (plug)

: : on it. (it's an 8-bit executable)

: Please inform us! What's the name? Is it on the archive?

: -Tim

I have this one. I can't recall the name off-hand. It has the music from

alot of different games in one big executable file with a menu. Off the

top of my head I know it has the music from AstroChase, Protector (3 I think),

Starleage Baseball, Archon, Blue Max 2012 (or whatever the # was), RobinHood,

Master of Time (cool techno sounding) and some others I'm sure I'm forgetting.

There's two colums of about 15 - so about 30 selections. I'll dig it up/

I'd put it at the archive - BUT! You guys haven't fixed my problem of not

being able to read/write atari 1050 SS/SD disks yet! and, I suppose the

question of Copyright comes up since the music was yanked out of copyrighted

programs and is part of the copyright I'd assume. Anyway... anyone got

a 850 for sale cheaply?

Or want to fix mine?

Sen

You will have to get that from the other Matt but I ran
across it in '82 or earlier I think. I definitely remember
calling his board in '83 and we had come to know each other over
the board by then.

At the time it was about the best around regardless of
machine. I liked it over the boards running on Apples. If I
remember the article he said he had also written it for the
computer Atari put out later, the one not based on the 6502.

4022. Screen change

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-02 01:14:59 UTC
From: NOLRAM@delphi.com
Message-ID: <931101.72899.NOLRAM@delphi.com>
Source record: 104479

When one doesn't touch the keyboard for a couple of minutes(on the 8-bit) the screen changes colors.
How can I access this and make it stop, or tell me when it's about o happen so I can put up a screen saver of my own.

4023. Re: Screen change

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-02 05:19:56 UTC
From: Bill Marcum <BMARCUM@delphi.com>
Message-ID: <931102.01196.BMARCUM@delphi.com>
Source record: 104480

Memory location 77 is the "attract mode" counter. It's set to zero when you press a key, and it increments every four seconds until it reaches 127. If your program does a POKE 77,0 now and then, the color change won't happen.

Bill Marcum bmarcum@delphi.com

Well, unless you wanna program a "TSR" (really called an interrupt on
the 8bit) to check the status of the "color change mode" (technically
called "attract mode"- get it? attracts your attention), you'd be forced
to have this test be done within a program.

Checking location 77 (decimal) in memory will return a number from 0 to
(what, 128? higher?). Anyways, the two important numbers are 0 and 128.
Actually, just 128. When location 77 is showing a 128 (it counts upwards
from zero VERY slowly), it starts affecting the colors.

I know im being VERY confusing tonight, sorry :)...

a SIMPLE example is this:

```
10 PRINT "THE COLORS WILL CHANGE RIGHT WHEN YOU"
15 PRINT "RUN THIS! (DONT PRESS A KEY!)"
20 POKE 77,128
```

type that in in BASIC and RUN it...

another example is:

```
10 PRINT "THE COLORS WILL NEVER CHANGE!"
15 SETCOLOR 1,0,2:REM DARK GREY TEXT
20 SETCOLOR 2,0,0:REM BLACK BACKGROUND
25 POKE 77,0:REM ATTRACT MODE ALWAYS OFF...
30 IF PEEK(53279)=7 THEN GOTO 25
```

Source record: 104487

hm..I thought I was getting a call... hmmm

anyways..that line 30 of my last post should say:

30 IF PEEK(53279)=7 THEN GOTO 25

that makes a loop to line 25 until you press any of the console keys
(start, select, option)..

Another location in memory (78?) handles WHAT to "do" to the color
pallete to make it go crazy.

I've noticed annoying purple and green Barney the Dinosaur colors which
pop up if you let the standard Atari colors (black border, blue text
background) go into attract mode.

YIK! :)

I've already contacted Adaptec regarding their 4000a and 4070 controller cards, and as far as Adaptec Inc. is concerned, they are obsolete and they will no longer provide support for them.

There is a company in California, though - that still has several Adaptecs in stock and manuals. I'll have to remember the name and post it here.

OK. If the ATR8000 (about which I know little) is designed
from a software point of view to talk to a Xebec S-1410 controller
(very common in that generation of equipment) it may take some
real low level kludging to get it to work with the Adaptec controllers.
I am currently trying to replace some Xebec S-1410's with the Adaptec
4070 on some old PC equipment. Reverse engineering at best is tricky.

Specifically, there are modifications to make to the Adaptec boards
to switch them to SASI mode hardware wise. Also, the format commands
work differently. Third, the Adaptec reads drive info from the drive,
the S-1410 gets it from the host computer. This is where I am currently
hung up, the Adaptec ignores the command, the PC software waits for a
response. So I am modifying the PC software.

Don't know if you are trying anything similar .. but figured any info
might give a few clues.

4031. Atari 2600 items for sale

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-02 19:01:25 UTC
From: cohen@GOMEZ.phys.virginia.edu
Message-ID: <00974F11.37C36660@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 104493
Cross-posted to: comp.sys.atari.8bit,misc.forsale

Atari 2600 system and items for sale:

Atari 2600 complete unit- original style:
in excellent condition, with all cables, TV/GAME switch box, and
(if you need one) a 300 ohm-->75 ohm adapter (allows hooking to the cable-
ready connector (75 ohm) on newer TV's that do not have the 300 ohm antena
connectors found in older TV sets), and a 75 ohm-->300 ohm adapter (allows
a direct connection of cable to the "TV in" port on the switch box, as nowadays
vitrually nobody uses the 300 ohm antena cables that the switch box is built
for). (The above adapters can be readily purchased from TV shops and from
Radio Shack and electronics suppliers, I mention them just to let you know
that in case you need them, I can supply them...)

Atari 2600 unit- jr. style-
This is the newer model, which is MUCH smaller, and looks similar to the
7800 design. This is also a complete unit with all parts.

VID-TARI:
A black hard plastic protective hood that goes on top of the Atari 2600, with
a place to put the cartridges and manuals on the top of it; it also allows
joysticks and power supply cable to be connected, so the whole system can be
conveniently operated with it

Atari joysticks

Higher quality game joysticks (various types).

Atari paddles

2 Atari catalogs.

A storage box for 24 cartridges (Atari 2600/5200/7800) or cassettes or even
8-track casettes if the need arises. Wooden base, smoked clear hard-plastic
top, blue velvet-like inside.

CARTRIDGES-

GunSlinger/Target Shoot
Pele's Soccer
Joust
Raiders of the Lost Arc (Lucasfilm/Atari)
Space Jokey (Vidtec)
Chase
Jr. Pac Man
M.A.D. (US Games)

In Atari Classics there is a tidbit about using the Gemulator on the IBM to Emulate the ST, and then running Xformer on under Gemulator to emulate the 8bit, virtually emulating the 8bit platform on the IBM.

Has anyone tried this, and if so what kind or results, speed, etc.

This built in screen saver is known as the Attract mode, and is accessable through POKEing location 77. Now, quoting the book "Your Atari Computer: a guide to ATARI 400/800 personal computers"(lon poole)...

" Setting this location to 0 disables attract mode on the display screen. This happens automatically whenever a key on the keyboard is pressed. Setting this location to 254 enables attract mode. This happens automatically after nine minutes without a key being pressed. "

Okay, an example would be...

POKE 77,0

in BASIC. I hope that this is useful for you.

4036. 1400XL

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-03 02:48:13 UTC
From: glenn.saunders@bcsinfo.bcs.org
Message-ID: <9311012316.A4041wk@bcsinfo.bcs.org>
Source record: 104494

Did I hear someone ask about the 1400XL?
I have one and I can honestly say that it is he best 8-bit Atari ever produced.
The only thing it doesn't have is banked ram, but that can be remedied.
It already has a Freddie chip for 65XE-like expansions, and better upgrade compatibility than 800XL upgrades due to this chip being on board.
Most people tend to lump the 1400XL in with the 1200XL in overall design, but this is wrong.
The only thing it shares with the 1200XL is a _similar_ but not identical case, and the keyboard.
It is not a 9V 8-bit, it is a 5V one like the XL/XEs, but it also has a 12 volt line for powering the drives.
Some have said that the 1450 is different from the 1400 internally, I disagree.
There must have been some different models in the prototype stage, granted, but my board says "1450" on it.
It has everything the 1450XLD has, except 2 things.
The drives, and the FDC daughterboard.
It has a 34 pin floppy port (or possibly other uses) underneath the PBI (yes, these do have XL-style PBIs).
It has an internal 300 baud modem and speech chip.
Unfortunately this has caused me problems where I thought I'd have lots of fun with this.
The reason is that I run a MUX system and there is an EPROM inside with the handlers which loads on cold start.
These handlers seem to interfere with th MUX OS, or have from my experiments...
I may be able to fix this, I've been a little squeamish, but after I removed this custom EPROM I was able to boot
up the 1400 as a MUX slave!
I'll probably throw the EPROM back in and see if it turns over--after I back up the EPROM to disk just in case.

4037. 1400XL

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-03 02:49:20 UTC

Source record: 104495

To complete my thoughts on the 1400XL....
It has much better composite out than the 1200XL, but still no chroma out.
Right now I have it set up with composite acting as chroma in a split video
scenario (my BBS is using the composite)
on one 1802 monitor and it is quite acceptable, almost fooled me into thinking
it actually had chroma.
The joystick ports are in line with the case, not diagonal, and the cart port
is further towards the edge of the case.
I had to do extensive cutting for this, and the repositioned and extra ports on
the back (the back is like swiss
cheese with all the ports).
My 1400XL has a Revision B Basic (yick) internal.
I believe the 1400XL series is a 1984 project, way after the 1200XL, and right
before the XE.
This explains the hybrid design some.
Using a 1200XL style case for the XLD made more sense, a design they already
had, than the 800XL case style.
Just think, the 800XL cart port would really have been in the way in an XLD.
The XLD drives are by far the most unusual floppy drives for a micro.
Double sided ENHANCED density.
I'm not sure if they can do DS DD, I doubt it.
{_And each side was treated as a separate drive.
The bottom line is that the 1400 series combines the best look and feel of the
XL/XEs with the best functionality
of the XL/XEs plus its own unique features like the modem and speech chip...
The speech chip is not well documented, I do know it can multitask with the
screen on, it does it during self test!
"ATARI SELF TEST, PRESS START, SELECT, OR RESET" it says!
Hearing it play the sound test while it is still talking is something you'd
never experience (Pokey music and speech)
with a software speech system.
But I can not tell whether the chip can change tone, from Basic all I can
produce is monotone ala Wargames.

Hi there,

Does anybody know where I can obtain a copy of the so called 'Technical Reference Notes' ? It should consist of the OS User Manual, the Hardware Manual the OS Source Listing, all together in one package...

Does anybody know if it's also electronically available somewhere ? (The complete package or seperate parts...)

Thanks in advance, Greetings,

--Ivo van Poorten

False.

There are a number of replacement OSes, CSS's UltraSpeed+ among them,
that use page 4 for some of their enhancements. (I'm scratching the deep
recesses of my memory here, but doesn't page 4 contain the cassette buffer?)
If you want your MyDOS shell routine to be compatible with all upgraded OSes,
I would advise you to be very careful on the use of page 4.

We have it in the Cleveland Free-Net Atari SIG.

TELNET freenet-in-a.cwru.edu, type "go atari" to reach the Atari SIG, and
then look around in the "Atari Library" area.

For sale-

Composite color monitor, 12" screen, with audio and video RCA inputs.
Made in Japan by NEC.

Excellent condition - I dare say "LIKE NEW"!
Picture and sound quality are excellent. Manual included (but is hardly
necessary).
For use with Home computers, VCR, security systems, etc.

Asking $90 or best offer.
Please e-mail to address COHEN@GOMEZ.PHYS.VIRGINIA.EDU or call (804)293-8973.
Thanks.

Very often you'll get the message:

"Sorry, this machine already has the maximum allowable number of users.
Connection closed by foreign host."

They enforce this to keep things running reasonably well for those who are
on the system. It's easiest to get in on weekend mornings, in my
experience, but I can usually get in after many repeated attempts any time
I want to.

I would also point out that they just recently installed new hardware, and
the system has yet to fully recover.

Keep trying, and good luck!

I think you're having your problem from using the number address instead
of the name address when you telnet. I had the same problem until I started to
use the "freenet-in-[a,b,or c].cwru.edu" address. The Freenet startup screen
also says something about this. I hope this helps.

If you consider DD sectors as 128 bytes MFM sectors (i.e. 1050 native mode)
than I agree with you!

I'm still not convinced they're 256 bytes MFM sectors.

>Single density ONLY drives puke on 'em! They may only have 128 bytes of
>usuable data, but they are not single density sectors! (period!)

Yeah, that's because the 810 is an FM only drive. It can't read ANY MFM sectors
regardles if they're 128 bytes or 256 bytes long.

From: lmurdock@austin.onu.edu
Message-ID: <1993Nov5.195230.79078@austin.onu.edu>
Source record: 104266

I was just reading through a computer magazine/catalog, and saw some really nice 14.4 kbps modems. I know that the 850 maxes out at 9600 baud, but what about some of the other similar devices (MIO, etc.) I remember hearing someone say that they could reach 19.2kbps (I think) with one of the other interfaces, but what is there maximum speeds? Also, has anyone ever though of writing a packet compression for the 8-bit? I am not all that familiar with modem compression, but it appears to me that if a modem supports some type of compression scheme, then the modem appears to be transmitting information at one speed (say 9600 baud), when it actually transmitting much faster (say, 14.4 or 19.2 kbps). Am I correct about these assumptions? Is it possible to create such a program so that a modem connected to an 850 interface can appear to communicate at something faster than 9600 Baud?

In addition, does the 850 really max out at 9600 baud, or can it be coaxed into something faster? I mean, in 1980 when it was released, 9600 baud was so SCREAMING FAST, that Atari may have just truncated any information about it operating faster. Sounds odd, I know, but Atari has done stranger things in its lifetime...

Does anyone know where I can place an order for an
Atari 130XE 8bit computer. The old Antic Magazine
used to have lots of places listed for mail order
but the great old magazine isn't around anymore.

Does anyone have an Atari 130XE (with a good drive)
that is up for sale? Does anyone know the address
to a good mail-order computer company that sells
the old good 'ole 8bit line of Atari goddies? Is there
a newer Atari 8bit model out? (Yeah, I doubt that one)

This request may seem strange to many of you, but
its a hobby and my old Atari 400 is just not doing
well these days.

Thanks!

P.S. Does anyone have Bounty Bob Returns?

Michael, someone sent me a so-called Technical Reference manual from the
Cleveland Freenet a year or two ago; it was _NOT_ the manual Poorten is
referring to (which came from Atari), and moreover was missing half of
one of the later chapters (in the latter half of the "teens" I believe).
I would like to be able to clearly identify this manual to you, by author
and title, but I have either misplaced it OR thrown it away, as I cannot
find it at the moment.

I would caution those seeking the "real" Technical Reference Notes to
keep looking, even if they pick up the manual from the Freenet...

4064. Starlan stuff for sale... (complete starlan network)

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-07 17:24:37 UTC
From: spam@iastate.edu
Message-ID: <spam.752693077@pv3805.vincent.iastate.edu>
Source record: 104276

Well, my previous offer generate absolutely no response...

Anyhow, wth my current network configuration, starlan is becomming
less & less relevent as I am going completely ethernet. So, I'm
offering ud for sale:

6 DOS Starlan-1 boards
Software for same (diagnostics, Application Prog Ref manual, Network program,
training package)
Manuals for same (Applications Prog Ref Manual, Technical Ref Manual,
Installation & maintainence guide (I and II), User's and DOS server guide,
assorted pamphlets)

1 3b1/7300/etc Starlan board.
Software for same (Diagnostics, network program)
Manual for same (Users guide manual)

1 NEU Network extension Unit. Allows you to tree off to 11 network lengths.

A few lengths of RJ45 flat cable.

A few RJ45 wall-mount connectors.

I have no idea about the worth of all this, so make an offer.

I'm mostly looking to get a 3b1 ethernet board/software/cable.

4069. SIO2PC and the R-Verter

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-08 02:16:30 UTC
From: ross@unisys.co.nz
Message-ID: <1993Nov8.021630.28043@unisys.co.nz>
Source record: 104281

I dusted off the old 800XL over the weekend and to my amazement it
all still worked. Ah, that familiar graunching of the disk drive...

Anyway, I've also got the specs for the SIO2PC interface; this seems
to be very similar to the R-Verter interface from AID, which provides
an RS232 to SIO bus connection. The R-Verter appears to use TTL voltage
levels rather than true RS232, but I've been able to drive PC connections
up to 9600 bps without a problem.

So I was wondering if anyone has tried to run SIO2PC through the
R-Verter. Does the software require modification to talk to the
different interface?. Any experiences/suggestions welcome.

Cheers,
Ross

Source record: 104283

I recently picked up a used 800XL (with few docs) to add to my
collection of micros. It came with lots of game disks - some boot
into a menu that lets me run the games, but others leave me in BASIC.
I can load DOS (2.5?) to list the disks, but don't understand how to
load any of the games that are listed. Could someone help me by
providing a short description of the different types of executable
files for the Atari 800XL, and how to load and run them.

Thanks!

Bill

From: jscharrl@PROBLEM_WITH_INEWS_GATEWAY_FILE
Message-ID: <2blul1$kj4@news.belwue.de>
Source record: 104284

Hi!

Your main problem seems to be that you are not pressing the OPTION-key
when you switch your XL on, so you start your computer with BASIC. If
you have files on a disk with no gamedos, you can start the ".COM",
".EXE" or the ".OBJ" files with the "L"-option in the DOS. If you want
to start ".BAS"-files you'll have to start your computer with BASIC
and then type Run "....." ('.....' stands for the Filename). For the
".TUR" or ".TBS"-files you'll need Turbo-Basic XL.

(If you see in the Directory "file com" this means that the file is
called "file.com")

I hope I could help!
Jochen

> A few months ago, in Atari Classics there was ad from Best Electronics,
>in which they were working on a an Rtime 8 compatible clock cartridge, does
>anyone know if this was ever carried out and if its available

I've got a rumor on that! I've talked to Derek Fern from Micro Discount in
GB. He claimed that his company were working on this cartridge to be sold
by Best Electronics upon completion.

When I met hin on the fair in Hanau/Germany earlier this year, the cartridge
wasn't ready yet. He told me an interesting story about it.

Apparently Micro Discount received all necessary source codes for the Rtime8
software. After this they passed it on to an independent developer. This guy
apparently dissapeared with all the documentation and some other testing
equipement. Therefore Micro Discount couldn't continue the developement.

On the fair, Derek Fern even asked the A.R.G.S. (ABBUC Regional Gruppe
Stuttgart) to continue the developement of an Rtime8 compatible cartridge.
This because A.R.G.S. developed its own Rtime8 alike, not really compatible,
but similar with some functions.

Maybe Peter Straif could expand on that, since it was him who tried to
write the drivers for it.

4077. 800xl or 65xe or 130xe for sale anyone?

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-09 05:42:37 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <qDgqcc4w165w@cyberden.sf.ca.us>
Source record: 104293

Man...
I'm sick of this
Popping my poor 1200xl motherboards in and out (now my stock one
is resetting/booting/crashing if I push it around the
wrong way when putting the keyboard and it's case (the
top half) on the thing!)
Popping my poor keyboard in and out! (I have to convince it to
recognize my [SHIFT] and [CONTROL] keys these days!)
Forcing the monitor, power, and SIO ports into it all
Etc.etc.etc. (drives don't wanna talk some times, the modem
doesn't get "heard" unless the cable in it is just right)

IN OTHER WORDS, FOLKS! MY SYSTEM IS SLOWLY BUT SURELY BITING THE DUST!

.....)^;

And this is all happening when I'm working on so many different projects
(ScotchDOS, Finder (ooh! finder? I'll explain later), and MyBBS (a fun
project which is impressive to people who understand the complexity of
programming and realize I'm 18 and using an Atari 8bit ;) ;) ;)))

Anyways.. ON TOP OF THAT, I'm really thinking that app. $400 isn't all
that much money (HEY! Get 100 users of my BBS and charge $4 each!?
hahah!) (just kidding folks, I'm not that cheap hahah!)

$400? What.. oh .. forgot to mention :) NO I'M NOT GETTING AN IBM! :)
I wanna get a Black Box really BAD!

And not ONLY will it help my drive space expand and let me organize my
system, but it'll ALSO let me hook up my 2400 and whatever ELSE I get my
hands onto (anyone want an SX212? tee-hee-hee!).

BUT! 1200xl's can't connect to good ol' Black Boxes.
So I want an 800xl or 65xe. Preferably an 800xl ;) Unless
you've got a cheap Transkey setup (ehehe) with the 65xe :) ...

Anyways... to sum it all up..

1) Who's got a cheap 800xl or 65xe for sale (PREFERABLY with
extra RAM (256k or more... I've been babied) (yeah, using
Mac Centrises! haha! jk))

2) How much are Black Box pre-set-up Hard Drive systems going
for these days? (If anyone's got it off hand.. I DO have
CSS's phone numbers and address, thanx :))

3) Anyone got a Transkey? :) Or a better question, can an almost
60 year old electrician handle the delicate work of setting up

a Transkey? (I think I can get my hand on some keyboards, BUT
HOW DO YOU TELL IF THEY'LL WORK WITH THE TRANSKEY!?) :)

Thanx a ton everyone...

Oh, and as for Finder. Well, this is getting a bit out of hand, but it's
a first try at using Icons and Windows together and getting them to work
nicely.

It forces you to use a RAMdisk (set up as drive 9 at the moment.. hey,
this is all just theory testing folsk! :)), and have a directory which
holds all your windows.

Now think of it like this: Each window file simply holds the size and
position and attributes of the window (and possibly the applic-
ation which created it)

Then, say you had a word processor or editor program that works
with this Windowing environment... it would have it's own big
file which contains what's inside the window, so any other prog-
ram can let you scroll around and stuff within the window without
reloading the application (you'll have a pulldown menu for swap-
ping between programs)

Other ditties include a "behind the scenes" screen which gets quickly
drawn (so you dont see the windows restacking when they're "priority"
(who's on top of who) gets changed or they get moved, resized, deleted,
etc.)
and a 1k array which holds what windows take up what parts of the screen,
so for example window >1< was on top of window >2<, this array would look
sorta like this:

```
00000000000000000000000000000000
00000000000222220000000000000000
00000000000222220000000000000000
00000000000222111111111111100000
00000000000222111111111111100000
00000000000222111111111111100000
00000000000222111111111111100000
00000000000001111111111111100000
00000000000001111111111111100000
00000000000000000000000000000000
```

something like that but bigger and using bytes not ASCII values
(otherwise you'd be stuck with a max of 9 windows on the screen!) (for
now it's 26, btw - A-Z :) but with MyDOS it can be about 66..)

Source record: 104294

---contdfromlast---

Anyways... when you click on the screen and it knows your within window 2 (there's a "2" in the array!), it will determine if that's the "top" window (in the farthest position in an array called WinPrior() which changes size), and if it's not, it'll remove it from the priority list, pull everyone else back (ie, window #1 in this example), and place it on the top, the redraw it so the "2"s will then overlap the "1"s!

It's not the fastest or most efficient, but HEY NEITHER IS THE MAC! :)

Anyways... the drawing routine was speeded up by the aid of a Hyper E: handler being installed (i know - CHEATER! :)), and I could probably VERY easily store ALL of the window data in memory and have it saved and loaded at the end and startup of programs..

Also, it'd probably be VERY easy for me to, say, make an editor that can OPEN MORE THAN ONE TEXT AT A TIME! (ie, swap via the RAMdisk :) hehe)

EAT YOUR HEART OUT TEACH-TEXT! :)

Anyways... anyone interested

I know it hasn't been done (and FINISHED!) yet by anyone else (unless Diamond GOS does it better..!?!) so THERE NYEAH! :)

l8r (I'm in a very hyper mood folks, btw :))

Hi!

I heard from the English trader who wanted to develope this item that
he has lost contact to the developer, it won't be released at all!
(This information is some months old, so it probably isn't
up-to-date). The silver lining is a clock/centronics cartridge by
Roland Buehler & Holger Pfeil which will be released as soon as
they'll manage to find a company to build the boards...

SpartaDOS 3.2 works with it, but SpartaDOS-X doesn't (yet), so it
won't be a 100% Rtime8.

Bye,
Jochen

Hi guys,

I've found another local guy (they're beginning to come out of the woodwork) who has an old ATR-8000 he'd like to sell to a good home. He says it's the 64K model with a Z80 inside, and comes with the user manual and a CP/M manual. He installed a terminal/Atari switch to replace a jumper that existed, but it is otherwise a stock unit. Can someone give me an idea of what these things are worth? If there is interest, I can get questions answered, and help complete the sale for the guy.

Thanks!

I like to know everyone's reason or opinions. I belong to Delphi I know that
of the
three ATARI supporting systems it's the "least active", but it seems like
all the old great programmers once belonged there, why did they leave? why is
there so little interest in it?

I checked out the others, but the prices for anything are so high
they don't even support Internet to it's fullest.
?????

I have never heard of Weather Tamers from CBS software. What's it about?
I do have Trains, not too bad of a game - I don't recall too much about it.
As far as software distributers (the few that are still left) check the FAQ
I guess.

Source record: 104303

Well. I'm the Atari8 bit SysOp for Delphi and I can easily explain why
all the famous 8bitters left: ST users

About 2 years ago, Delphi's ST staff decided that 8bitters were too lowly
to have in the same database together, so they got rid of the separate
8bit section, incorporating them both into ONE area.

This became even worse for the 8bitters when the ST'ers started dumping
all over the 8bitters and hassling them to convert platforms, etc..

Finally, several months ago, I got Delphi to create several splinter 8bit
Atari areas, including the now present file database and announcements
area.

You are correct. For the price, Delphi cant be beat, especially considering
that Delphi is the _ONLY_ pay service that provides free FTP, Telnet,
Usenet, Gopher, Wais, etc. access DIRECTLY into the internet..and NOT
just e-mail access into the I, like GEnie and CI$ do.

$20.00/month for 20hours of online time or $10.00 for 4 hours just CANT
be beaten, considering the full direct internet access available.

(Kamaro Kid says he's Atari 8-bit sigop on Delphi.)
I can't affort Genie, Delphi, Prodigy, CIS, etc. anyway, but
back when I tried Delphi, in order to download the monthly
Analog disk, it was a pretty unpleasant experience. I litteraly
sat there and paid, like $5.00/hr (I don't remember exactly
how much) to watch my cursor blink while the Delphi computer
was doing time sharing. Litterally half of my $5/hr was
for waiting in the que to be serviced. Downloads were never
there, (well almost), and when they were, my x-modem couldn't
handle the timeout timesharing and wouldn't work. I guess it
is a lot better today.

4094. graphics boards

Newsgroup: comp.sys.atari.8bit

Hi guys/gals,

Just a quick curiosity question...

Does anyone know of any graphics boards available for the
8 bits??

Other than Ataris' 80 column text thing?

Mark.

4095. 800XL semi defunct, want to revive it!

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-10 15:04:02 UTC
From: ye05748@inet.d48.lilly.com
Message-ID: <1993Nov10.100403.626@inet.d48.lilly.com>
Source record: 104358

I've got an 800XL lying about in a box in my attic, along with a couple of plastic bags full of games. They've been there for about 4 years now...

But Why, you ask.

First the tape "drive" stopped working. It had always been a bit dodgy, though not as bad as a friends Commode 64 tape. It stopped dead. This was a little annoying, as I'd just (finally) started programming the damn thing. I did still manage to get my Mandelbrot generator working, but couldn't save or print (no printer). Oh well. It was nice for a week.

I spent a while with a voltmeter trying to find the pins on the 800-tape lead which carry in and out, so I could rig up a normal tape deck as save/load, but no joy. I could get a signal through (could hear it on the telly) but no response from the 800 - presumably theres a ready signal or something which I have to set too.

Then the cartridge port stopped working. What can I say? This happened about 6 months later.

I don't know whether the joystick port still works.

All internal operations (well, booting and running basic progs, which is all I can do without any input devices except keys) seem to be fine.

If anybody out there ever had similar problems, and can give me any tech clues/pointers, please post or mail me. I'd love to get the thing up and running again. In case I do, does anyone know whether I can interface it to a SVGA pc type monitor, or a multisync NEC-3D?

Many thanks - J

Andrew,

CC65 is almost the GNU project equivalent for the 8 bit. Not as fast
at compiling and linking as the commercially available LightSpeed C
(check ATV or B&C computervisions for that) but it supports more than
LSC does, due to other people writing additional modules, like one for
130XE memory support and stuff. Check the Atari archive for tons of
ARC files in a cc65/ subdirectory.

Anyone interested in obtaining a collection of old computer magazines
for FREE? They are just taking up space and I have no time to use them.
The types of magazines I have are Family Computing, Compute!, and Antic.
I have about 2-3 years worth of each, some old and some newer. There are
a few misc magazines like Analog and Atari explorer with it. I would like
to get rid of the whole thing, which weighs about 18 lbs
So if you are interested in obtaining this stuff, please EMAIL me. Of
course you will have to pay for the shipping. First person to email me
will get it.

I have to agree with Bill Marcum ! Really, who needs a graphics board (Hercules etc) on an ATARI 8-bit nowadays ? I mean, a new and complete 386SX costs about $500 as far as I know (that price includes SVGA, monitor etc). If you want to "enjoy" Hercules (which is a VERY ANTIQUE hardware extension for the PC) you are better off with a new PC.

It is ABSOLUTELY not worth the money to purchase a Hercules, Soundblaster, Adlib (and so on and so forth) for your 8-bit when you have such great graphics modes built in. It is possible to create graphic modes like 160*192 with 128 colours (16 per line) nowadays ! It is possible to play digitized sounds and with the right sound tool you can create awsome melodies !

So, instead of looking for alternatives let's better work on better software routines that everybody can enjoy ! Maybe it is nice to see a Hercules connected to the 8-bit but just a minority will be able to enjoy that. With software you can give everybody something he can use, feel, hear and play ! See my point ?

Yours ATARIly,

Ulf Petersen

4119. Instructions for Atari 8-bit games

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-12 00:43:35 UTC
From: Jeff_M_Lodoen@cup.portal.com
Message-ID: <95520@cup.portal.com>
Source record: 104375
Cross-posted to: comp.sys.atari.8bit,rec.games.video.classic

I've gotten some new titles for my Atari 8-bit, and again
several have no docs. I'm posting this to c.s.a.8 and r.g.v.c
because some of them did appear on other game systems.

I bought Imagic 1-2-3. It's a disk that includes Laser Gates,
Wing War and Quick Step.

I saved a post giving instructions for the ColecoVision version
of "Wing War", but I'll take more help.

"Quick Step" is giving me trouble, I don't have a clue what's
going on. This showed up for the 2600, anybody have docs?

"Laser Gates" appeared for the 2600. This seems more complicated,
Help requested.

Last one seems to be an Atari exclusive, "Thunderfox". What is the
object of the game?

Thanks in advance.

Jeff_M_Lodoen@cup.portal.com

> On the fair, Derek Fern even asked the A.R.G.S. (ABBUC Regional Gruppe
> Stuttgart) to continue the developement of an Rtime8 compatible cartridge.
> This because A.R.G.S. developed its own Rtime8 alike, not really compatible,
> but similar with some functions.
>
It sure would be nice to see a compatible R-Time8 cart., but it
would also be nice to see an internal clock so you wouldn't have to stack
cartridges, esp. with a XL. Shouldn't this be possible?

Hi!

I really didn't meant a price of 500 DM! No PC-user nowadays wants the Hercules card, so it is in the range of 10-20 DM, and the complete interface (without the card) is about 35 DM (I didn't forget a 0). So it is even cheaper than the XEP 80 (and much faster!). Besides, the interface maybe used with other PC-cards too!

Bye,
Jochen

Well... ok.... keep in mind that some programs take up a lot (or a
@ertain area of) RAM and need BASI@ to be disabled (hold [Option] as you
boot, or if you have a 400/800 or 1200xl, just pull out the @artridge
hehe).

As for DOS 2.5 (and 2.0, and MyDOS's DUP, and many other DOS's DUP's),
the @ommands you'll really need a lot are:

A - dire<tory list
B - jump to @artridge (or BASI@, I assume)
@ - @opy (sorry..ikky keyboard)
D - delete
E - rename
F - lok
G - unlok
H & I - write DOS and format
L - load binary or load memory -
this is what loads up the games and other files that are
in "ma<hine language"... they start with the two bytes
255,255 and range in size from tiny to 127k or more(!?)

the loadable files with this @ommand are:
.@OM
.OBJ
.EXE
some dont have extenders
some files have strange extenders (from the good
old days of the BBSes that used the extender
to store the "des<ription" of a file - ie,
"B"asi< "G"ame "0"-@osts 0 @redits to DL
I have a few "OX9"s or something... those arw
usually @OMs I guess... I have no idea :)

the programs you load from BASI@ are
.BAS
some of THESE dont have extenders

the extender I use the most for TurboBASI@ XL is
.TBS

listed BASI@ and TurboBASI@ XL's are
.LST

the list goes on and on and on, but all of these should be the only
really relevant ones, other than of @ourse

data and @onfig
.DAT
.@NF

text and dox
.TXT
.DO@

Delphi is NOT the _ONLY_ service that provides the above mentioned features.
Portal provides the exact same features at a reasonable price ($30 for 30 PC
Pursuit hours [no SprintNet charges for non-local access]). I tried Delphi
for a while but found Portal more useful for me.

Sure, that would be another approach. The ARGS RTime8 is much easier to handle
than a built-in model. You can still stack cartridges with this one, i.e.
ARGS also offers a cartridge port enhancement where you can use at least 4 (?)
cartridges simultanously. It looks like a part of a PC motherboard with its
slots. It's MUCH smaller of course.

I believe it should be possible to do an internal clock, while
staying compatible with RTime8. Of course, I don't have the
RTime8, or specs for it, so I may be wrong. Anyone care to
point me to some specs, maybe I'll give it a try. (I just started
working for Dallas Semiconductor, who just happens to make some
real-time clock chips).

There was an arc of SynCalc templates up on Genie last year that I downloaded for teachers...one for grades, one for homework and another for attendance...If you what it I'll put it up in the archive. Also there's a great pd (now) spreadsheet called SpeedCalc that was in Compute! mag. Now that they have released their atari software to the pd you can get it from Genie or I can put it up in the archive also. What do you say?

Message-ID: <2c4oec$mmb@news.ysu.edu>
Source record: 104409

Well I just had to see what Tomscopy.arc was and the docs were
impressive... It supposed to copy ss/sd, ss/dd, ss/id (id is IBM
512 byte sectors), ds/dd, ds/id, ss/80 track, ds/80 track.
Well I was interested in this cuz I wnat to have a copy program
that uses my Puff 3 1/2" 720k drive.
**->It doesn't format an ultra speed drive and if you turn the
format off it reads f o r e v e r the 2880 sectors s l o w speed.
The attract mode on the computer came on and I got so tired
watching the screen change colors I just hit reset. Reset does
not give DOS either...your locked in to the program.

Hi guys !

A friend of mine told me that there is a great game called AGENT USA
published by Tom Snyder Productions. The task of this game is it to save
and explore the US at the same time - that's all I know ! Anyways, he told me that this is
a classic game everybody should have.
Does anybody know where I can still buy AGENT USA ? Also, I am still
looking for THE EIDOLON and KORONIS RIFT !

If you guys have any idea or suggestions please don't hesitate to contact
me !

Yours Atarily,

Ulf Petersen

If the spec joseph is talking about is the Rtime8/SDCS supplement
manual, there's not much in there. But it does mention a source
file on the Rtime8 disk, which would be quite useful I'd think.
Or maybe someone out there has a dead Rtime8 they'd like to
donate?

While I'm at it, I was also thinking of attempting an IDE interface.
I just got the IDE spec, and have some data sheets for floppy/IDE
controllers. The question I have for the group is: would it
be better to make an adapter for standard IBM IDE cards, or
use a separate IC? I think the adapter would be cheaper, since
IDE cards are only about $5-10. And, most of the ICs are surface
mount packages, which wouldn't work well for the average hardware
hacker.

Don't know if I'll ever get either one working, but hey,
I need a new hardware project :-)

As I read the IDE specs, an interface card for a PC would be little more than address selection and buffering. I strongly suspect that and interface for an ISA bus card would be of the same level of difficulty as one to directly support an IDE drive. Since less is generally better, a direct IDE drive interface would be the approach I would take, unless I was aiming towards supporting one of those CPUless ISA busses, and having multiple ISA bus card support.

Then again, might I suggest a direct SCSI drive support? Someplace I could probably (from a friend) dig up a fairly simple interface basically consisting of one 6821 PIA and buffers. Or at least the of the SASI interface he used (only one line different from SCSI). 'Course, he probably has it buried in storage. But then, I also recall an article or two in '68 Micro Journal on SASI interfaces. And those I could find.

>Don't know if I'll ever get either one working, but hey,

well, that's true. I have a couple reasons for using the PC card:
I've got a spare one, it would be easy to add support for floppies
and maybe serial ports included on some IDE cards, and you can
find smaller IDE drives for low $$ (40M for $100 new).

so it would mostly be due to what I have at hand, rather than
a well thought out plan.

"Then again, might I suggest a direct SCSI drive support?"

But SCSI has already been done for the Atari 8-bit. IDE drives are plentiful, and there are a lot of used "small" (i.e. less than 100meg) IDE hard drives on the market from IBM-compatible owners moving to larger and larger drives.

Also, an IDE interface for the Atari 8-bits is on Atari Classics' magazine's "Dream Street" list. <grin>

4159. Agent USA, da best game ever....

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-15 13:51:21 UTC
From: msteve@magnus.acs.ohio-state.edu
Message-ID: <2c81gp$9me@charm.magnus.acs.ohio-state.edu>
Source record: 104421

This is an excellent game. But the goal of the game was to clear the Fuzzbomb. An object that made regular people into zombies, who would then roam (usually in packs...) after non-fuzzed people. Your weapons are your wits and these crystals that you grow.

The crystals would unfuzz people and people could carry 10 of them as protection against fuzz attackers. To keep track of the fuzz bomb and fuzz progress, you needed to go to state capitals to check maps. You travelled around the country by train.

You had to get tickets to go where you wanted (or if you timed it right, not even buy one) by train. Armed with the crystals.

I loved this game. I kept playing it until somebody told me I was actually learning something... ;)

4160. Re:Tomscopy too slow

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-15 13:52:26 UTC
From: husky@bull.mimuw.edu.pl
Message-ID: <9311151349.AA20870@bull.mimuw.edu.pl>
Source record: 104422

Toms Copier is very fast on drives supporting the (european) TURBO hi-speed mode. If you want to use it on an ultra speed drive, try to remove the two first chunks of the file. They contain the turbo routines ($100-$1xx) and their init adress ($100). Then it should work, if only ultra speed was turned on before (with eg. Qmeg OS). To quit Tomscopy press reset while holding down the option key - your computer will reboot.

Michal Kurcewic (husky@bull.mimuw.edu.pl)

4161. Yorky 256k memory upgrade.

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-15 14:33:18 UTC
From: RG9@VAX.YORK.AC.UK
Message-ID: <9311151433.AA16727@deepthought.cs.utexas.edu>
Source record: 104423

You may have heard of my plug in 256k memory upgrade for teh 800XL but I have had further discussions with various people and we are exploring the possibility of adding a parallel printer interface into the box as well, possibly as an optional extra at the time of purchase.

This is still experimental but we forsee no problems and I am looking for feedback from the rest of the 8bit community.

Of course the price will have to increase, the current price for the Yorky is 50pounds plus postage, and the additional printer interface will add about 15 - 20 pounds to the price. We may also be able to retro fit an interface to any Yorkies that have already been sold!

This development is going to cost me money so I would be very grateful for some feedback about all its aspects, price, abilities, availability etc etc.

Please e-mail me on RG9@UK.AC.YORK.TOWER or RG9@UK.AC.YORK.VAX

If you are outside the UK then you will have to reverse the ordering (or so I am told) try RG9@TOWER.YORK.AC.UK or RG9@VAX.YORK.AC.UK

I look forward to hearing from many of you soon.

I can also get you a separate printer interface that plugs into the PBI of an 800XL or a 130XE, priced around #20, e-mail for more info.

Richard Gore

4162. Lemmings Clone.

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-15 14:33:27 UTC
From: RG9@VAX.YORK.AC.UK
Message-ID: <9311151433.AA16733@deepthought.cs.utexas.edu>
Source record: 104424

For all those game players out there, you may be interested to know a clone of teh classic game Lemmings is now available here in England, Germany & Holland!

Its called 'Thw Brundles' & costs 15pounds (UK sterling) plus postage.

I don't actually sell this game but I know a man who does, so if anybody is interested let me know and I'll see what I can do about arranging payment etc etc. I'm not promising anything but I can have a chat with the man.

The game itself is very addictive, you can control it with a Joystick, a mouse (ST or Amiga), CX 85 keypad or an animation station (what ever that may be!). Support is given for machines with upto 256k of memory to prevent disk access for every level. As far as I can tell it mimicks the original Lemmings with blockers, builders, floaters etc etc.
the background graphics are very good, the Brundles (Lemmings) themselves are small but move around pretty well, in fact I think this game is very, very well done, theres loads of these things walking all over the screen, some floating some digging etc, its pretty impressive. At the moment there are 60 levels but within a month or so the disks will be updated with 100 levels, of course previous disk buyers will be upgraded free of charge.

The game itself was programmed by the people behind KE-SOFT in Germany.

All you Light gun owners will be pleased to hear there is a new game available, based on the classic Space Invaders. It features animated colour graphics, fast action and digitised speech on a 130XE (or compatible).
Its name, ALIEN BLAST, priced at 4.95 (pounds) and available now from DGS in the UK who ship worldwide.

Feel free to send me any e-mail messages about the above two games, I can help much more with enquiries about Alien Blast as I wrote it but I might also be able to help you get a copy of The Brundles, by copy I mean original, if anybody asks for pirate copies I will pass the details onto the appropriate authorities!

Ricahrd Gore
(ooops can't even spell my own name now, Richard Gore is correct!)

|> While I'm at it, I was also thinking of attempting an IDE interface.

Before you get too far, contact Bob Woolley of SLCC (San Leandro Comp. Club) (75126.3446@compuserve.com). He has written a series of articles in the SLCC journal about adding an IDE drive to the XL/XE series. The hardware is very small (1 chip? but he wastes half the drive with only 8-bit i/f), and the software wasn't too bad. I have heard that he is in the process of integrating an IDE drive into a 1200XL case.

Lazer Gates (Imagic) - Good game. From time to time, you'll see a platform (cannot remember what it looks like, other than it is flat, and looks like you c{n land the ship on it), that you land on top of. You'll get fuel and energy for shields. Try to get through the levels as fast as you can while killing all oponents that come your way. Getting through the levels somewhat fast will make it easier to get to the next levels. Going faster won't necessarly make you use fuel that much faster. If you need more help with this game, let me know. It's been awhile since I've played it, but I know if I run it, the game will come back to me.

Thunderfox: I'm going to assume that your refering to the cart, so here are the instructions:

Maneuver the Thunderfox by moving the joystick handle up or down. Speed up or slow down by moving the joystick left or right, depending on your direction of travel. To change direction of travel, move the joystick in the opposite direction of travel. Your status indicators are at the bottom of the screen. Here you'll find your score, the number of ships and bombs you have left, the level, the weapon in use, and the long range scanner that shows the distance between the Phalon transporter and it's mothership.

Your Weapons: You have two types of weapons: lasers and bombs. To choose between the two, press OPTION on your XL/XE or the SPACEBAR. To fire a weapon, press the joystick button. The Thunderfox can carry six bombs at a time. If you use all of your bombs, return to the mothership to reload. Use bombs to destroy the anti-gravity stabilizers and ground installiations. Use lasers to fight airborne enemy attacks and the Crystal Guardian.

Your Mission: Your mission, should you wish to accept it, is to prevent completion of the Phalon war machine by location and destroying the energy crystals. The crystals are situated inside the heavily defended Phalon transporters and are guarded by the fearsome Crystal Guardian robot. You have no time to loose--once the transporter reaches the mothership, you will be destroyed by a death missile and the solar system will be doomed. Your mission continues as long as you're able to destroy transporters and ends when all of your Thunderfox airships are gone. Your orders are as follows:

1. Press START or the joystick fire button to start the game and to launch the Thunderfox from its mothership.

2. Travel to the far right-hand side of the outside of the transporter and bomb the two anti-gravity stabilizers that block access into the transporter. You must bomb each stabilizer FIVE TIMES. As you attempt to bomb the stabilizers, you'll have to fight off a varity of alien flying formations and evade whirling fighter craft. The flying alien formations can destroy you instantly.

3. Turn back so you can enter the transporter's thermonuclear laser room. Navigate through this room to the laser gates to get to the Crystal Guardian. You will be demolished if you are hit by lasers or if you touch the walls. Keep an eye on the radition-level indicator at the top of the screen. If you stay too long in this room, the radition level becomes too high and you perish.

4. Once you make it through the thermonuclear laser room, you enter the crystal room and confront the Crystal Guardian. Destroy the guardian and the crystals by shooting past the mobile wall at the guardian's head 10 times. Be careful--the Crystal Guardian will be shooting lasers at you the entire time.

5. The game resumes at the next level as you go out to confront the next Phalon transporter.

6. When the scoreboard appears, enter your initials next to your score. To enter your initials, move the joystick until the letter you want is highlighted then press the fire button. Select the arrow that points to the left to backspace. Select FIN once you have

>A friend of mine told me that there is a great game called AGENT USA
>published by Tom Snyder Productions. The task of this game is it to save
>and explore the US at the same time - that's all I know ! Anyways, he told me that this is
a classic game everybody should have.

This was a favorite of mine; I shamefully admit I did not have a legal
copy. The theme is basically "invasion of the body snatchers"; some
evil aliens or disease or somesuch is spreading across the country
and you have to stop it. The screen is pretty simple; at each location
you have a train depot (half the screen is the tracks and the train and
the other half you can wander around in and down to the other "rooms");
each location also has between 1-3 (?maybe just 2) additional connected
rooms. There is also a train schedule and I think some kind of map available
at each location. Little people wander around like gas molecules in a
random walk. The infected ones are really obvious. When they bump into
uninfected people the uninfected one gets infected too. You have to
change them back by dropping crystals for them to run into. If you
get bumped by an infected person you lose a crystal or crystals; if you
lose all of them you become a pod person too and lose. You have to grow
lots of crystals by depositing them on the ground and waiting (they
magically multiply) and "sheperd" the uninfected people who will take
them all up away from your crystal patch. You have to get the maximum
number of crystals (99 I think) and run headlong into the evil thing that
looks like a TV set that is the source of the disease. You also have to
find it first. To do this you hop from location to location on the train.
This is where the schedule booth comes in handy.
I think this was intended or at least marketed as an educational game.
It is a pretty good one though. Once I won once it lost its appeal,
however, so your mileage may very. I found it pretty addicting.

4169. Instructions for Atari 8-bit games

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-15 21:03:03 UTC
From: Amos.Jackson@f47.n282.z1.tdkt.kksys.com
Message-ID: <753411937.AA09837@tdkt.kksys.com>
Source record: 104438

Part 2 Thunderfox: Select FIN once you have finished entering your initials.

Strategy: Avoid the transporter platforms. The platforms are located at the front and the center left and right sizes of the Phalon war machine. The ground installations are located on the sides, between the platforms. The anti-gravity stabilizers are located on the sides of the Phalon war machine, at the rear on top of the engines (towards the front of the engines). While flying, if you run into the transporter platforms, you will be destroyed. Score extra points by bombing ground installiations or an alien formation.

I must stop here because my bbs time is up.

Tom Snyder Productions? Might be the same... thought someone else put it out though. Played it a couple times... not too bad for a "learning" game. Look for it wherever they sell old Atari software (i.e.: American Techna-Vision, and the like) under educational software. It's one of those "learn as you play" games, great for kids about 8+. Decent graphics, good ideas, etc.

Synapse? Hmm, maybe not... thought I just remembered the "carrier co.".

We lost newsfeed here for a while... don't know if anyone replied yet.
Just in case, check out American Techna-Vision. They deal in all kinds of
Atari 8-bit software and some hardware. U.S., Canada, overseas, etc. rates
given in their latest catalog. Sorry, don't know it by heart. Anyone have
the Atari FAQ lying about? It's usually posted the end of the month.
Haven't seen it in a while. I think it has the list of Atari retailers,
dealers, and such in it.

Well, good luck!

I once thought about building an IDE-interface for the Atari (right,
as I got the IDE-specs :) but there's only one big problem:
IDE drives tend to be 512 bytes/sector and I couldn't find a DOS that
would use more than 256 bps. The only solution would be to use only
the first 256 bytes of each sector with the effect of reducing the
capacity of the drive by 50%.

If there's a DOS which is able to access 512 bytes/sector, please
tell me. The interface itself should be no big problem.

BTW: The IDE-"interface" consists only of some latches and some address-
decoding stuff. It's not really an interface, more of an extension-cord
to the ISA-bus.

so long,
Hias

Message-ID: <CGLJ81.7pM@sunblossom.ge.com>
Source record: 104442

I'm still running into ex-8-bitters in town! Here is an update to
my list of (used) items for sale. A few items dropped off, and a
few have been added. After each time I post, I'll wait a few days
for replies to trickle in, then contact the person(s) involved.
Postage to be paid by buyer; package deals have preference:

Hardware, all in working condition:

Atari 800 $30 (now Qty 2)
48K, stock, with power supply

Indus GT Disk Drive $50
includes P/S and cable, all manuals
and Indus software (word proc., data
manager, spread sheet, DOS XL with
synchromesh II)

Atari 850 Interface $40
power supply, serial cable, printer
cable

ATR-8000 $100
64K model w/Z80, CP/M manual and
other user's manual

Cartridges, with box and docs, full working condition.

Atari BASIC cartridge $10
(includes BASIC reference manual)

Sega Congo Bongo $5 <-reduced

Cartridges (all w/o docs or box, but in working condition):

Atari BASIC $5
Atari Missile Command $5
Atari Centipede $5
Atari Star Raiders $10
AtariWriter $10
Parker Brothers Astro Chase $5 <-reduced
Parker Brothers Popeye $5 <-reduced
Parker Brothers Super Cobra $5 <-reduced
Epyx Alien Garden $3 <-reduced

Books:

Compute!'s First Book of Atari $7
Compute!'s Second Book of Atari $7

Compute!'s First Book of Atari Graphics $7
The ATARI Assembler (Reston) $7
ATARI Games & Recreations (Reward Books) $7

(for collectors of Atari arcana)

Computers for people (1982 dilithium press) $5
DOS 3 (Atari) $1

Disks (originals, working condition, but no docs or box):

Mr. Robot & His Robot Factory (Datamost) $5
Rescue on Fractalus (Epyx/Lucas Games) $7

All the above are in working condition. On request, I can throw in the following non-working (but classic) hardware with any other purchase:

410 Program Recorder

how about reading each sector before writing it, and treating
each 512 byte sector as 2 256 byte sectors? It would slow
writes down a bit, but it probably wouldn't even be noticeable
when its connected to an 8bit.

Thats what I planned on trying, but maybe there's a good
reason not to do this? I thought I'd put a microcontroller
with a little RAM on the PBI, and maybe a floppy controller
as well.

I'm looking for extension cords (male to female) for the nine-pin joystick socket on my Atari 8 bit/Atari 2600/Colecovision/Intellivision...

I went to Radio Shack looking looking for these, and all they had to offer me were these very thick nine-foot, nine-pin, nine-dollar cables.

I want something thin and unshielded (and cheap). Where should I look?

PS - If anyone out there has the remote control atari joysticks for sale, let me know!

The following message is forwarded
From: markus@unirsvl.rsvl.unisys.com (Mark Vallevand x7880)

[begin forwarded message]

I send this last month, but it didn't show up in the list. Here it is again:
...
This is a blurb from a friend who has begun selling his software. It can be
added to the list of 8-Bit Atari venders and developers. I can't
post to csa8 because of a buggy system, but I can mail and FTP. I will
also FTP a copy of this blurb to the umich archive. If you post this to
csa8, it will reach users faster. I don't know when we will be able to post
messages. I will try to recreate it verbatim...

ATARI DEALERS ATARI DEALERS ATARI DEALERS

Send your software catalog (to prove you're a dealership) to ChildsPlay SoftWare
and receive free samples of new software upon release. Attempting to provide,
NEW and affordable software for the ATARI 8-bit computers, you won't want to
miss this opportunity to be included on the mailing list of this software power
house! ChildsPlay SoftWare has been developing ATARI software for over ten
years, most programs given out to BBS's or as shareware releases. Now the
wiser, new software is being marketed to dealerships only. One title is ready
to ship TODAY, more are waiting for packaging, still others under development.
The game disks come in a plastic disk blister (clam-shell) with a colorful
insert to attract on-site buyers. A picture of the game is displayed on the
insert to easily identify what is being purchased.

To receive your sample. and be included on the proprietary (not resold) mailing
list, send you software catalog to the address below. Hurry! A limited
quantity of samples will be shipped to key areas in late 1993 for this first
release, sone sample per dealership.

ATARI USERS ATARI USERS ATARI USERS

Chances are, you the reader are a user, instead of a dealer. You might know of
a dealer in your area that retails ATARI software. By bringing in this add to
the attention of your nearest dealer, you might earn yourself a free Mah Jong
game disk from ChildsPlay SoftWare. Mah Jong is a one player, low stress,
strategy game for the ATARI computer. 100 tiles are placed on a pile, your task
is to remove the pile by selecting matching pairs. 5 levels go from super easy
to quite difficult, some thinking before playing is required. 130 colorful
tiles and random playment make every level different each time you play.

To qualify for a free sample, bring a copy of this ad (or facsimle) to your nearest ATARI dealer/retailer. Ask the manager to include your name in his sample request. All dealers who respond to this ad, postmarked before December 31, 1993, and include the name of the person who contacted them with this ad, WILL RECEIVE TWO SAMPLES and a note to release one sample to you for word of mouth advertising. This offer is good everywhere permitted by law, and will expire January 31, 1994.

ChildsPlay SoftWare Services
6812 Hill Place
Crystal, Minnesota 55427-2259
(No phone inquiries please!)

I have seen the Mah Jong game demo'ed. It looks very nice. The packaging also looks first rate. I have not played the game yet.

According to my black box manual, which is at home right
now so my memory may be fooling me, this is essentially
what the black box does for 512 byte/sector SCSI drives,
with exactly that consequence.

I already had that idea some time ago, but I thought about building
a dumb interface card for the parallel bus and write an extension to
the ROM. That implied the problem that I couldn't use so much memory
(yes, 512 Bytes are a lot if you want to stay compatible with most
of the programs). So I dropped it. Another Idea would be to use a small
RAM-chip on the interface (could be mapped over the floating-point code),
but I'm not quite sure if it would be better to build a standard-PBI
device then (amost same effort).

Comments? What would you prefer, an easy-to-build-and-develop dumb
interface plus a new OS-ROM, or a (professional?) PBI-device with its
own RAM and ROM (would cost some $$$ more)? I haven't built a PBI-device
yet (but a lot of interfaces which were plugged into the parallel bus),
but I have the specs.

so long,
Hias

Hi!

> Please tell us were we can get that interface, sounds great to me !

The interface was developed by the ARGS-"Hardwareteam". I could give
you the adress, but I don't really know what Roland Buehler wants to
do with the interface. Perhaps it will be produced by Bob Puff (CSS).
If you really want the interface, send me your adress - perhaps Roland
will send you the schematics!

WARNING: Until now there is nearly no software for it!!

Bye,
Jochen

Source record: 104207

```
The Sparta manual says that vs.2.3 has no built in r-time 8 handler
like 3.2d has and the memlo gives almost an extra 4000 bytes.
R-time8 is handled externally. Zhandler wont work with it.
3.2 has these advantages over 2.3:
-better time/date support
-internal r-time 8 interface
-internal jiffy clock interface
-internal 32 keyboard buffer
-automatic mini-buffer syystem for fast put/get
-new vectors added for m/l support
-control returned to DOS if DOS was active during RESET
-supportsboth STARTUP.BAT & AUTORUN.SYS
-compatible w/BASICXE, 1200XLs and modified operating systems
-BASIC ON/OFF within batch files
-NOISY I/O flag recognition
-Support for Supra hard drive interface
<3.2 recommended only for the MIO interface also>
-full read capability for Atari dos 2.5 duel dens.
Personally, I'd never use 2.3 with a hard drive.

Message-ID: <2cglnu$586@news.belwue.de>
Source record: 104212

Hi Freax!

I know this is close to an ad, but if anyone is interested in the
schematics for an PC-interface (plus disc) for the price of 10 DM
write to me:

jscharrl@ba-stuttgart.de

(this is not a real ad because the 10 DM are for the postage and it is
easier to send a 10 DM-banknote than some coins!)

You'll get this price back, if you send useful software for the
interface to the developer (so this is not an ad at all).

Bye,
Jochen (in the hope of surviving this message)

Is it any better than MyJong? (no, I didnt write it hehe)
My Jong allows for up to 128 (I think) different tiles, and different
widths, heights, and lengths of the pyramids, as well as different game
variations like "@an take from above", "@an take up/down as well as
left/right" and "@an take as long as you @an see any of the 6 sides of
it", and even has a @heater for you (finds a legal mat<h if it @an)

:)

Yeah, but who's for sour<e-<ode? I love sour<e-<ode! :) I thrive on it.
I've thought of different ways of handling en<oding it (UUe'ing just
bloats up a file, even straight "legal" text files .. so why not just
@onvert what you HAVE to @onvert!? Ie, you might have a line that says
simply:
10 X=X+1
what's the point of bloating it by en<oding? just leave it
but if you had a line like
10 PRINT "! HELLO EVERYONE! "
where the "!" is a @lears<reen and the " HELLO EVERYONE! " is all in
inverse, well, you're going to have to xvert it.. either that or write
all your programs w/o non-"legal" @hara<ters! (yawn! hehe)
anyways..)

I think you all get my point.. sorta.. who'd be for either
posting @ode here
or perhaps adding
a "alt.sour<e.atari.8bit"
or something group???
I am! :)

Okay..I finally got all my atari 8bit system upgrades into
a nice baby case. Got my transkey..and HAD 2, count em, 2mio's.
Due to a STUPID wiring error on my part I totally fried my 1megMIO.
I picked up a junky 256k mio board for $10 from someone who didnt
know anything about engineering...and thus..only the RAM works on it.
So..I can either spend a few weeks moving 8 chips from one board
to the other (VERY VERY painful if you have ever seen the ZIP chips they
used) or I can get rid of some of my IBM stuff.

SO, anybody got an MIO or a black box? the MIO would be better
since it can fit into my baby case nicely...
I have full size 386DX20 and DX25 boards..and
a very itty bitty 386SX16 board...

4212. Atari ST 8-bit emulator program question

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-19 13:51:02 UTC
From: winters@access.digex.net
Message-ID: <2cij06$784@access.digex.net>
Source record: 104221

I am going to try and get in touch with the author from Canada, but would like to know if anyone is using the ST (I have a 1040ST) Atari 8-bit emulator program - the one on the Atari ST archives. I fired it up last night and was amazed to see the old 8-bit DOS screen come up and was even able to write a BASIC program - maybe someone someday will write a Coleco simulator on a Pentium! :--) I take it that you don't need to use a 8-bit drive (plus cable) to hook up to your ATARI and can use a TOS RAM disk? Could someone please just give me a brief intro on how to set up a ST to take a ARC file (I have a few ARC files sitting on my C drive, obtained from 8-bit archives) and make it run on this 8-bit emulator?
If this Canadian author is still around, hats off to him and the people who helped him with it! I couldn't believe the almost identical "click" sound when typing in Atari 8-bit BASIC commands or DOS commands!
Also, kind of nice being able to fit the tiny size of 8-bit games on a miniscule portion of my "massive" 20MB drive. :--)
Thanks for any opinions or advice on this subject.

> DM or $?

The cartridge-slot-expansion costs about 20-30 DM. It has NO
electronic parts on it, it is simply the expansion of the slot to 3-5
slots (You could build it on your own).

I don't know what the clock-cart costs, but the combined
clock/centronics-cart is about 60 DM (plus 10 DM for the ARGS-OS, to
handle the centronics interface). It is NOT an RTime8 replacement, but
at least SpartaDOS 3.2 works with it.

Analog Computing Magazines for sale ($1/issue $5/lot + shipping (4 lb total))
(excellent condition unless noted otherwise)

Anyone unfamiliar with this 8 bit Atari magazine - it was one of the best.
It carried full source - change what you didn't like or extend it! IMHO,
in days of failing software houses, this is how all software should be
provided. You will also find tutorials on programming, memory maps, and
help columns. A must have for any serious Atarian.

3/84 (disk drive issue, Parker's "Intro to Action, Pt 1", disk miser,
binary file menu/loader, Hudson's super ml game Planetary Defense) *

4/84 (adventure special, Parker's "Intro to Action, Pt 2", file'em,
games Hudson's H_Bug, Moriarty's Crash Dive, Munch'In Climb'In
communication for the handicapped) *

7/84 (games special, Buzz-Zap!, Hudson's Bacterion, Action games -
Stars 3D and Bounce, also AlterDos, What Is It, Auto Line
Numbering+, ConTEXT, and Scredit) *

8/84 (printer utilities, Proset, Matt*Edit, Graph Es, Fergee File
printer, Printer Survey, Plotkin's Analog Card File, Touch Tone
Dialer Update - games - Bennett's Avalanche, Comeau's Spy Plane) *

3/89 (controlling videodisc system from Atari, Master Memory Map VIII,
un-Sprites, games - King's Pebbles, Martone's Electra-Ball, survey
XEGS cartridge and disk games)

4/89 (pixel averaging, Master Memory Map IX, univert, Kolbe's ml game
Krazy Mazes)

5/89 (Ultimate Graphics File Converter, Master Memory Map X, Hudson's
Boot Camp, Timmin's ml game Crazy Clown Jumper, Super Command
Processor pt 1 (memory resident DOS - add your own commands.))

6/89 (Adventure issue, Super Command Processor pt 2, Sector to Printer,
Disk Directory Alphabetizer, Accessing Atari XL Hidden Memory,
games - Marble Magic and Secret Agent: Mission 1)

* previously owned by now defunct club, slightly more worn than 3/89-6/89
issues (but still not abused) and has club name in magic marker on front.

4228. Drive cases; 24-pin wide carriage printer-for sale!

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-21 22:06:16 UTC
From: cohen@GOMEZ.phys.virginia.edu
Message-ID: <00975E19.30A4A940@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 104239
Cross-posted to: comp.sys.cbm,comp.sys.atari.8bit

I have a few external drive cases for sale-

1. External case for a single full height drive, with a linear power supply, fuse, power cables, on/off switch. Currently houses a full-height IBM 360K drive.
I'll sell with or without the drive; asking $19 empty, $26.50 with drive.

2. As #1 above, but DOUBLE the size (will hold 2 full height drives, or 4 half height drives). currenly holds 2 full height 360K IBM drives, and I also have half-height 360K drives (DS/DD) that can be installed in it.
I'll sell with or without the drives; asking $40 empty, $55 with 2 drives.

If you can use any of the above, please e-mail an offer to address COHEN@GOMEZ.PHYS.VIRGINIA.EDU or call (804) 293-8973. Thanks!

24-pin, wide carriage Toshiba printer for sale-

Toshiba P341 SL. 24-pin, wide-carriage printer

This is a wide-carriage printer with a fast-mode print quality (216 cps at 12 cpi, bidirectional with logic seeking), 24-pin LQ modes and fonts. Also have a quite mode, and many other features.
All features can be selected from the front panel (which has an LCD window). It is also, of course, programmable by software commands. The printer has both friction (single sheet) feeder as well as a tractor pin-feeder. The tractor is built in, and when not in use folds neatly to a hidden compartment at the back of the printer.

The printer is very clean, and instructions are included.

I'll sell to a reasonable offer ($100-$200 range?).

Please e-mail to COHEN@GOMEZ.PHYS.VIRGINIA.EDU , or call (804) 293-8973.
Thanks!

4229. 1050 Happy, Indus Drive, etc. 4 Sale

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-22 01:02:48 UTC
From: Barry.Jones@f160.n3603.z1.FIDONET.ORG
Message-ID: <795.2CF0E68A@mechanic.fidonet.org>
Source record: 104251

For those who can appreciate the advantages of having a 1050 Happy Drive (besides making unauthorized copies, that is) I'm putting mine up for sale. She's still whistles right along in fast mode. I'm looking for the best offer.

Also, I've got an Indus w/ its case, cable and software for sale. The registration is a little off when used as a boot drive (which I'm sure a hardware maven could adjust) but works fine as a secondary.

From: phbill@cyberden.sf.ca.us
Message-ID: <B3PeDc3w165w@cyberden.sf.ca.us>
Source record: 104245

Well, I got my last issue of _A@_ (now I need $$ to resubs<ribe!) a few
days ba<k and read it @over to @over of @ourse ;) and am interested
GREATLY in that there 3-frames / se<ond video @apturer mentioned in the
bit about the Halle meeting! :)

I'm @urious if anyone has done or thought of adding in audio and video
@apture through a simple set of handlers... just imagine:

```
DIM SOUND$(10000)
OPEN #1,4,0,"A:" the "audio devi<e"
BGET #1,ADR(SOUND$),10000 some XIOs or something @ould
handle the rate and even maybe
spe<ial effe<ts!?!? :) :) :)
PRINT "PRESS A KEY TO HEAR IT"
@LOSE #1
GET N
OPEN #1,8,0,"A:"
BPUT #1,ADR(SOUND$),10000
```

Wouldnt that be rude!?!? :)
And maybe the sampler @ould even handle [Start]-key ending.. imagin in
A<tion!:

```
size_of_sound_blok_read = BlokGet ( 1, put_sound_here, max_size)
```

niiifty :)

and same @ould go for video! :)

```
GRAPHI@S 9
OPEN #1,4,0,"V:"
REPEAT
BGET #1,DPEEK(88),7680
UNTIL PEEK(764)<255
GET N
```

Man.. that'd be so keen. Who agrees. Who has @omments? Who's up to
making this!!?!??!? :)

I mean, we already have su<h a ni<e operating system with K:eyboard,
D:isk_drive, E:ditor, S:<reen, @:assette, M:ouse, R:S232_port,
T:alking_spee<h_synthesizer, why not add A:udio_@apture and
V:ideo_@apture to this unlimited list of devi<e handlers!?!?!? :)

Wow.. :)

```

4237. ATR8000 HD interface questions

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-22 17:08:47 UTC
From: curtis@darkwing.East.Sun.COM
Message-ID: <2cqrmv$jsv@dr-pepper.East.Sun.COM>
Source record: 104246

Hi everyone,

Well, seems I finally got around to putting my ATR8000 HD setup
together..... and I am not having much success.....

I have a Ztec 1000 board that goes into the ATR8000 that plugs
into the CPU socket and the CPU plugs into a socket on the Ztec.

There is then a 50 pin ribbon cable (SASI/SCSI?) that runs to a
Xebec card which then controls the hard disk(s).

If I run the SET program that is on a Mydos disk I was given (that
states it is for the Ztec hard disks), I can get the HD light to flash,
but I can never access the drives. I'm almost positive it is because
the MFM hard disk has not been physically formatted by the Xebec
controller.

Anyone have the docs on how to set this up, the only Ztec docs
I have is the one page installation of the Ztec 1000 board page.

I have a CPM disk of hard disk utilities with a program called
FORMAT but it says it is for WD1002 controlled hard disks and I
do not know what that is.

Anyone have any info on this setup ????? Is the 50 pin interface
SASI or SCSI or something else ? How do I physically format the
hard disk ?

Any info would be appreciated... I have quite a collection of Analog
magazines, so if you know of any info in there on this, let me know as
well (I haven't gotten around to checking them yet).

Thanks,

I use MYDOS 3.16 which came with the ATR-8000 and contains a special (?)
R: driver for the ATR-8000. Works for me. I never saw a comm program
that expects an R: driver which did not work with this setup.

Well, I had a problem w/ the plexiglass door on my Indus GT and while
fixing it I noticed a IBM floppy type connector on the motherboard, it
the exact size of a 3.5" floppy connector.

Does anyone have any info on this? or know if it actually works?

As I recall, there were two manuals with my Sparta Construction
Kit: a larger one that covered 1.1 and 2.3 and a smaller, sort of
addendum that covered 3.2. You might not have that addendum.

>Does anyone remember Journey to the Planets? If so, I would like to know how
>to get through the level with the machine that transforms objects from one
>form to another.

Hey, I can answer this one, since some kind sould answered it for me 1-2
months ago. :-)

You've probably already gotten the object that you need. A long flat
orange thing. It's actually a flying carpet. If you grab it and take it
back a couple of screens to the left, you can press a key that enables you
to fly across the valley. I didn't realize until I started typing this
that I don't rememeber exactly which key to press. It may have been up
arrow.

The one I'm still stuck on I think, is with the chest and the key. It
obviously looks like the key should open the chest, but I've tried lots of
combinations and can't seem to open it. It might take a keypress, and
that's why I couldn't find it -- or the flying carpet.

Hi guys !

Does anybody know where I can get some really nice tools and programmes
for the 1020 COLOR PLOTTER ? I'm especially interested in a tool that
allows you to print out pictures, like KOALA- or Micropainter-Pics, or
small text files !
Of course, tools that are in the Public Domain would be preferred :^) !
Please let me know where I can get these things ?

Thanks in advance !

Yours ATARIly

[snip]
Just drop it on the edge of the cliff (near the top), pick up the ball, and
then either push up or down (can't remember which) on the joystick while
standing over the flying carpet. That should do the trick!
>
>The one I'm still stuck on I think, is with the chest and the key. It
>obviously looks like the key should open the chest, but I've tried lots of

>that's why I couldn't find it -- or the flying carpet.
heheh, just answered that one a couple of weeks back, anyway here is the reply
I sent the other chap:

>>>I solved all the puzzles but one...there was one planet with one room
>>>where two blocks moved on the top of the screen, and you could change the
>>>color of the blocks by shooting at them, and in another room something
>>>fell down depending on the color of the blocks...I never found out how to
>>>get across the water in one of the rooms...can anybody help me?
OK, it's been some time, but I think I can more or less remember.
I can't remember exactly what colour blocks made what shapes fall, but one
of the two coloured blocks controlled which shape fell, and the other one
controlled the colour of the shape, it is quite easy to work this out, just
make a list (on paper!) of what falls when.
There are 3 shapes that fall, a big box, a long thin thing, and another long
thin thing with some extra bits that stick out of the sides which you can't
seem to pick up. (I'm not going to spoil the game by saying
what they are, you will find out!). Pick up the first long thin thing
mentioned, and then walk over to where the water is, stand right on the edge
and press the fire button, the object should then fall and extend the ground
under your feet forming a bridge. Just take it from there!
[end of my reply to other chap]

We are thinking about the same level here aren't we? Well if you build the
bridge, cross the river, you will find something on the otherside that will
help you pick up the key. Once you've done that it is just a case of making

sure the chest and key are the same colour, then catch the key and open the chest. If this doesn't work or you're thinking of a completely different level the mail me and I'll be pleased to help (solved all the levels and finished the game heheheh :-)).

4250. New products from DGS.

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-23 14:30:31 UTC
From: rg9@tower.york.ac.uk
Message-ID: <Pine.3.87.9311231401.A18953-0100000@tower.york.ac.uk>
Source record: 104308

This has been uploaded on behalf of Dean Garraghty/DGS, who are having difficulties in uploading messages at the moment.

MORE NEW PRODUCTS FROM D.G.S
==========

As I've said many times before, here at DGS we don't hang around when there are new products to be found! We have two new pieces of software available, a new piece of hardware, and then there's our new magazine!

New Software:

BOMBI - A new game from Power Per Post sold by DGS in the UK, Eire, and Australia only. Great 3D platform game. Disarm the bombs without getting killed! Great graphics and digitized sounds. UK Price: 4.95 pounds.

ALIEN BLAST - This new game is especially for light gun users! This is a version of the classic game Space Invaders, but you shoot the aliens with a light gun! Great graphics, and digitized speech (for 130XE and upgraded 800XL users). Runs on any XL/XE with 64K RAM or more. Light gun required. UK Price: 4.95 pounds. US price: $15 (including Air Mail sipping). US users pay in cash in US$. Price to Europe: 8 pounds.

New hardware:

DGS are pleased to announce that we now have stocks of the Rambit turbo load data recorder upgrade kit.

This piece of hardware will bring new life to your data recorder! It comes as a kit which you install in your 1010, XC12, or XC11 data recorder. Installation is very simple. Basically you solder 3 wires from the Rambit onto the data recorder's PCB, cut one track on the PCB, and solder 1 new capacitor to the PCB. Full fitting instructions are supplied (with diagrams).

The Rambit turbo load system allows you to load specially converted tapes at up to 3500 baud! Software (on turbo load tape) is included with the kit. This software will allow you to convert many tapes (including multi-stage load tapes) to turbo load format. This software has many advanced features, which also allows you to examine and change memory after loading tapes. This can help in converting tapes with non-standard loaders. However, many pre-done turbo format tapes are available (including 3 from DGS). Many of these games have not been available on disk, so having them on turbo load format is the next best thing!

The Rambit turbo load system is a MUST for people with no disk drive, or for those people who want to have fast access to tape-only software.

UK price: 13 pounds inc. P&P. US price: $30 including shipping. (US users pay in cash in US$).

New Magazine:

The first issue of our new magazine is finally back from the printers and is available now. For your copy of this first issue send US$5 in cash. A 4 issue subscription costs US$21.

Our Details:

DGS also sells a wide range of software, both commercial and PD. Our new full 25 page catalogue is available for just US$3 (NEW LOW PRICE!), or get a free copy when You buy any of our products! All US$ payments should be made in cash (or by I.M.O drawn in UK pounds. Calculate pounds price by US$ price divided by 2. E.g. $15 is 7.50pounds). USERS IN OTHER COUNTRIES SHOULD CONTACT US FOR PRICES AND PAYMENT DETAILS.

Send orders direct to:

Question:->In the 800xl, can you substitute the CO21697 antic
chip for the older CO12296 without further modifications?
I am trying to install a Newell 256k upgrade and with the CO12296
it seems more involved than the CO21697. I have these spare chips
and it seems easier just to plug it in rather than make 3 solder
connections more and cut a trace on the motherboard.

Thanks for clearing that up. I don't know why I remembered that as pushing
the up arrow key, but as you said, it only requires pushing up on the stick.

>Once you've done that it is just a case of making
>sure the chest and key are the same colour,

This was the key. I had always shot both blocks to be the same color, and
thus, the key and chest never matched. That's interesting that you can
complete the level without ever shooting the far block.

Thanks for your help.

John Harris - jharris@cup.portal.com

Anyone know if the 1020 plotter picdump program is posted to the umich Atari archive? It'll print out MicroIllustrator / Koala Pad images quite nicely, IN COLOR of course!. For that matter, does anyone have a list of descriptions or brief comments on all the files that are stored on umich? There are very few files online, so I'd assume a description file is kept somewhere, right? I Hope?!? Heck, I've several Megs of files for the old machines, and I still rmemeber what some of the files are and what they do... and more importantly, where I stashed them (I hate to label disks). It's just that I haven't really searched for anything for the 6502's for years now... not sure what some of the filenames refer to on the archive!

Hmm. Saw MULE, ugh. I'd stick to UTIL. It's on the umich archive under Diskutils or Diskutil, filename util.arc. VERY handy. The best I've seen so far. Just don't know how well it actually works... hard to explain. I've transferred a load of files to a 5 1/4" on an old 360k IBM drive, just need to get home to try it... and find time to. UTIL allows you to format a 5 1/4" disk to DD "MYDOS" format, and store MULTIPLE files on it! Uses the same dir structure as the Atari DOS would... nice! Make sure to use the /B option for binary mode though! REALLY self-explanatory, seems quite well-written, covers most needs... not sure, but I think it also works on the old style 1.2M 5 1/4" drives also! This you've just got to try!

4262. Journey to the Planers (for Atari 8-bit)

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-24 12:24:42 UTC
From: rje@cs.nott.ac.uk
Message-ID: <1993Nov24.122442.14322@cs.nott.ac.uk>
Source record: 104322
Cross-posted to: comp.sys.atari.8bit,alt.games.video.classic,rec.games.video.classic

After having answered a couple of questions on this game (Journey to the Planets), I've got one of my own (snigger!).

OK, on the flying carper planet (the solution for which was given a couple of posts ago!), there was this bug/feature where if you did certain things but didn't finish the level, a small wall (block?) would appear at some distance above your ship when you tried to take off and then follow your ship's horizontal movements, meaning that you couldn't leave the level. I once saw someone do this several times, but I never saw *exactly* what they did to manage it. I've never been able to recreate the situacion either. Anybody know how you do this?

A couple of other little bugs/features/oddities of the game are that on that same level, if you pick up the chain, but instead of going out the short way you go back to your ship the long way (walk right instead of left), when you get back to your ship the chain will suddenly have become much larger. Doesn't give you more points, but it makes a change! (I'm not 100% sure if the above procedure is correct, since I haven't played in some time, but it does involve walking right instead of left at some point!).

One cheat for the game is on the candelabra level, if you just go straight in, pick up the balloon, and go straight back to your ship without bothering about the cage or crab or anything else, then you finish the level and get *loads* of point for it! (don't worry if the balloon disapears when you reach the screen your ship is on, you still get the points!).

Anybody know of any other cheats/features for this game? Having seen these posts has revived my interest in the game, I'll have to see if I can dig it out sometime and finish just *one more time* heheheh. ;) Great game that!

(Joe wants to use 21697 Antic on 256k Newell upgrade to 800 xl.)
Yes, that will work. You don't have to make the additional three
connections if you use the 21697 Antic. Although I tested the
12296 on mine and it seemed to work fine without the three extra
connections, the refresh or something is only supposed to work
with the three connections on the 12296. The 21697 refreshes
without the three connections.

There is a desc file on UMICH Archive called 8bitcat.arc which will give
2 text files--both of which seem to be over 2 years old. With the
hundreds (thousands?) of PD/Shareware 8bit programs floating around,
I've always wondered why the archive has so few of them. It's probably
the old story of too many things to do-too few people to do them. I,
for one, would love to see an up-to-date description file for all the
8bit programs. Is there someone out there who would volunteer for
this assignment?

4265. Manuals for 800

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-24 15:39:15 UTC
From: trek@cbnewse.cb.att.com
Message-ID: <CH065M.7sr@cbnewse.cb.att.com>
Source record: 104327

I have the following manuals for sale:

Atari Basic ($1 + shipping for 2 lb)

The Atari Assembler
Compute's First Book of Atari
Compute's First Book of Atari Graphics

($3 each + shipping 1 lb each)

Wayne Booth trek@intgp1.att.com or trek@cbnewse.cb.att.com (708) 393-1905

4266. General mags with Atari articles - for sale

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-24 15:46:23 UTC
From: trek@cbnewse.cb.att.com
Message-ID: <CH06HH.7yx@cbnewse.cb.att.com>
Source record: 104328

Compute Magazine for sale ($1/issue, or $3/lot + 3 lb shipping (all in excellent condition) Although a general magazine, Atari geared articles are listed.

7/86 - (8 bit: 2 articles + 3 type in, ST: 2 articles + 1 programming)
10/86 - (8 bit: 4 articles + 4 type in, ST: 3 articles + 1 type in)
11/86 - (8 bit: 2 articles + 2 type in, ST: 3 articles + 1 type in)
12/86 - (8 bit: 2 articles + 3 type in, ST: 2 articles + 2 type in)

Creative Computing for sale ($2/lot + 3 lb shipping) (these are from a now defunct club collection - well used but still serviceable) Although a general magazine, well suited to 8 bitters. A bit more serious and fewer games with type in applications and utilities.

1976 - Mar/Apr (Vol 2/Issue 2) AI
1980 - Apr (software), May (apps to save money), Oct (Actor languages)

Micro - collection of articles applicable to Atari from Micro Magazine ($2 + 1 lb shipping) One of the more serious magazines for 6502s with both hardware and software articles.

1983 - Jul (computers compared), Sep (education), Oct (programming Techniques), Oct (character graphics)
1984 - Aug (whole mag- math functions, step/trace progs, hi res graphic prints)

Contact Wayne Booth trek@intgp1!att!com or (708) 393-1905

4267. Re: Instructions for Atari 8-bit games

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-25 03:28:44 UTC
From: jharris@cup.portal.com
Message-ID: <96688@cup.portal.com>
Source record: 104329

Now that I had the final clue, I tried playing this one more time, and succeeded in clearing all the planets. For those that haven't finished, I won't spoil anything by telling what I did next. After doing this though, I found myself back in space, and the map display was filled with all '+'es. I flew around for quite awhile, and there seemed to be one planet out there, but it would disappear and be repositioned any time I attempted to land on it. I received no messages about the game being over.

So my question is this. Am I still missing one final step? Any hints?

Thanks,
John Harris - jharris@cup.portal.com

Source record: 104332

timuszyn@jupiter.cse.utoledo.edu (Mr. Fixit) writes:

> Hmm. Saw MULE, ugh. I'd stick to UTIL. It's on the umich archive under
>Diskutils or Diskutil, filename util.arc. VERY handy. The best I've seen so

Remember, the one in util.arc is the older version, not the latest version.

As stated in the FAQ List (as long as I'm remembering it correctly), the latest
version is contained in 8bit/Diskutils/diskutil.arc.

4271. 800XL hw - emulation topics

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-25 15:31:04 UTC
From: borgen@stud.cs.uit.no
Message-ID: <1993Nov25.153104.24967@news.uit.no>
Source record: 104333

I have been working on a 6502 emulation core (adapted from STXformer) for the Amiga, and it seems to be stable enough to fit a machine on top of it now.
I am running the 800XL ROMs, and after 10 000 000 instructions I am somewhere around address $f300 (I think). As this takes 15 seconds I am a little unhappy about the speed. Part of the problem is that all reads and writes check if the address that is used needs special attention.

What I was hoping to avoid was the read checking. Are there any special places in the chips that have a latch that will trigger some event when you read from that address? I believe the C64 has one or two in the CIA chip timers - they will start counting when you read them.

Thanks in advance.

4279. Gauntlet blues!

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-26 10:59:34 UTC
From: RG9@VAX.YORK.AC.UK
Message-ID: <9311261059.AA10827@deepthought.cs.utexas.edu>
Source record: 104340

I have recently come across a problem with the game Gauntlet, the commercial version released by Mindscape in the US and US GOLD in the UK.

Heres the story, I own the original US GOLD (UK version) of the origianl game master disk, however I recently bought the Deeper Dungeons extension disk. This Deeper Dungeons however is the Mindscape version and guess what, the two are incompatible!!!!! US GOLD also did the Deeper Dungeons disk and I've no doubt the code is very nearly the same but Mindscape added some extra protection and now the two are incompatible.

So be warned if you buy Gauntlet and the Deeper Dungeons make sure you are getting compatible versions, ie both by Mindscape or both by US GOLD.

Now I would like to plead for help, as anybody got the original Mindscape master disk for sale at a very reasonable price, or maybe even the US GOLD version of the Deeper Dungeons?

If anybody can help please e-mail me (Richard Gore) at;

RG9@UK.AC.YORK.TOWER or RG9@UK.AC.YORK.VAX

NB from the USA you have to invert the uk.ac.york.vax bit to vax.york.ac.uk and same for the tower address (well I'm told you have to do this!!).

4282. Connection of an XL and XE

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-26 11:52:36 UTC
From: gfenwick@mcs.dundee.ac.uk
Message-ID: <2d4qm4$bnc@dux.dundee.ac.uk>
Source record: 104343

Is there anybody out there who can help me with this?
For many years I owned an 800XL and was generally happy with it. However,
I wouldn't have minded the extra memory of the 130XE. So when I saw a 130XE
advertised pretty cheap, I snapped it up. Now I have two computers i'm very
happy with. However.... I would be even happier if I could connect them
together, and write true two player games, etc.
So, can anybody tell me, what connections should I be making, and what
pokes/peeks? I know this can be done, because I saw a device driver which
allowed you to treat the joystick port as "J:" in the old Atari User magazine
(before the publishers decided to axe it, and it was bought by Page 6). This
let you read/write through various pins.
If this is true, then there is no need for a fancy interface to get
two Ataris to talk to each other (such as the 850).

On another point, when I bought the 130XE, I got an XC12 datacorder with it.
It looks just like the PHONEMARK datacorder, except its a different colour,
and it
doesn't need its own power supply. So why is the XC12 supposed to be better
than the Phonemark?

Thanks in advance for any help.

Graeme Fenwick

From: malay@stars.reston.paramax.com
Message-ID: <CH3yAC.CK7@bart.stars.reston.paramax.com>
Source record: 104345

My kid dropped my 130XE and in the process the switch
that is part of the Rambo XL broke - I dismantled
the XE and tested the switch - turns out it is NOT
a normal DPDT switch (on-off-on) - the middle position
switches on the alternate poles - I can't find this
switch in any electronics catalogs.

Anybody have any clues?? If I use a normal DPDT switch
then I can't turn on the OS that corresponds to the
middle switch position.

Maybe I should buy a new Rambo XL - who sells them??

Respond via e-mail.

Thanks,

Bob Malay

I will take an educated guess that a controller beginning with the two characters "WD..." (as in WD1002) is probably one of the "WESTERN DIGITAL" family of controller boards. (I have seen Western Digital controller cards for Ethernet LANs. I will assume that this same company makes controllers for hard drives?) Good luck with your ATR8000 ! I would be interested in learning whether or not the CP/M package for the ATR8000 is compatible with the CP/M package for the Commodore C128 and the CP/M package for the APPLE-][.

4296. Re: ATR8000 HD interface questions

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-27 23:08:05 UTC
From: snyder10@convex1.tcs.tulane.edu
Message-ID: <2d8mkl$sb9@news.cs.tulane.edu>
Source record: 104055

In article <CH5BoM.4IE@merk.com> winston@merk.com (Winston Smith) writes:
>learning whether or not the CP/M package for the ATR8000 is compatible with
>the CP/M package for the Commodore C128 and the CP/M package for the
>APPLE-][.

The CPM 2.2 that comes with the ATR is compatible with almost all the files
I gotten from the C64 archives as well as files found in the CPM archives.
Very few C64/128 would not work on my system...those were the ones that
broke protocal and made direct calls to the C64 itself (graphics mostly).

The unzip CPM file does work on the ATR... but only supports version 1.10
of zip...the zip up program looks like it does nothing more than put a
zip shell on the file with no (or little) compression.

Only thing I can tell the fellow reguarding the hard drive and controler is
SWP put out a disk with their hd interface that had a program to format
the hd and to let the Atari know it was there...it was a sep. disk with several
other utils, only seen it once and I do not have a copy....

4297. Info about ANALOG Computing magazine needed!

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-28 04:50:02 UTC
From: d91fe@krokis.pt.hk-r.se
Message-ID: <D91FE.93Nov28055002@krokis.pt.hk-r.se>
Source record: 104056

Greetings!

I'm currently searching for a couple of old text adventures that were obviously published in ANALOG Computing about 1983, and since I have just recently learned that this was an ATARI publication, I figured that this would be the best place to try.

The adventures in question are titled "Crash Dive" and "Adventure in the Fifth Dimension" respectively. They were written by Brian Moriarty.

Now, I would be extremely grateful for any of the following:

1) Information about in which exact issues those adventures were.

2) Information about how to acquire them.

3) The sources, in any form. Xeroxes, scans, typed-in, whatever.

4) An opportunity to buy the issues in question.

I would of course be prepared to pay for any reasonable expenses.

/Fredrik Ekman

I'm looking for a low price item.
Thanks.

4299. NEW DGS products

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-28 12:55:41 UTC
From: dx107@cleveland.Freenet.Edu
Message-ID: <9311281255.AA02189@nextsun.INS.CWRU.Edu>
Source record: 104060

MORE NEW PRODUCTS FROM D.G.S
==========

As I've said many times before, here at DGS we don't hang around when there are new products to be found! We have two new pieces of software available, a new piece of hardware, and then there's our new magazine!

New Software:

BOMBI - A new game from Power Per Post sold by DGS in the UK, Eire, and Australia only. Great 3D platform game. Disarm the bombs without getting killed! Great graphics and digitized sounds. UK Price: 4.95 pounds.

ALIEN BLAST - This new game is especially for light gun users! This is a version of the classic game Space Invaders, but you shoot the aliens with a light gun! Great graphics, and digitized speech (for 130XE and upgraded 800XL users). Runs on any XL/XE with 64K RAM or more. Light gun required. UK Price: 4.95 pounds. US price: $15 (including Air Mail sipping). US users pay in cash in US$. Price to Europe: 8 pounds.

New hardware:

DGS are pleased to announce that we now have stocks of the Rambit turbo load data recorder upgrade kit.

This piece of hardware will bring new life to your data recorder! It comes as a kit which you install in your 1010, XC12, or XC11 data recorder. Installation is very simple. Basically you solder 3 wires from the Rambit onto the data recorder's PCB, cut one track on the PCB, and solder 1 new capacitor to the PCB. Full fitting instructions are supplied (with diagrams).

The Rambit turbo load system allows you to load specially converted tapes at up to 3500 baud! Software (on turbo load tape) is included with the kit. This software will allow you to convert many tapes (including multi-stage load tapes) to turbo load format. This software has many advanced features, which also allows you to examine and change memory after loading tapes. This can help in converting tapes with non-standard loaders. However, many pre-done turbo format tapes are available (including 3 from DGS). Many of these games have not been available on disk, so having them on turbo load format is the next best thing!

The Rambit turbo load system is a MUST for people with no disk drive, or for those people who want to have fast access to tape-only software.

UK price: 13 pounds inc. P&P. US price: $30 including shipping. (US users pay in cash in US$).

New Magazine:

The first issue of our new magazine is finally back from the printers and is available now. For your copy of this first issue send US$5 in cash. A 4 issue subscription costs US$21.

Our Details:

DGS also sells a wide range of software, both commercial and PD. Our new full 25 page catalogue is available for just US$3 (NEW LOW PRICE!), or get a free copy when You buy any of our products! All US$ payments should be made in cash (or by I.M.O drawn in UK pounds. Calculate pounds price by US$ price divided by 2. E.g. $15 is 7.50pounds). USERS IN OTHER COUNTRIES SHOULD CONTACT US FOR PRICES AND PAYMENT DETAILS.

Send orders direct to:

I'm looking for a disk drive for a Atari 130. I've tried sending e-mail to the guy advertising a 1050 w/ Happy but I've gotten no answer. Any leads to MRC@Panda.COM

4302. Snapper v0.2 FTP Software DatabasE

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-29 03:01:04 UTC
From: karlm@highett.mel.dbce.csiro.au
Message-ID: <2dbolg$o34@news.dmpe.CSIRO.AU>
Source record: 104063
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

Hi there everyone out there in Net-Land!

Well today, after many problems (mainly finals ...) I release the
first official copy of SNAPPER. A few of us (Erlend, Hermann and I)
have noticed that there is a sad lacking of an information system to
find out what software is available for the good old ATARI range of
computers by FTP, so we created a project called SNAPPER. SNAPPER
is/will be a database of all the software we can find for FTP'ing.
The database is similar to the FISH index on the AMIGA (bleurgh ;^))
and the LINUX operating system. By compiling a database of what is
available, we hope to aide those "I've need of a XXXX type program.."
requests, and to ensure that people can always get the latest
software versions. A brief synopsis is in the file itself, as are
the instructions. We welcome all your comments, suggestions, praise!?
and hope that everyone will participate in the project by filling out
entries for us.

Well that's about it, If you have problems, whatever, feel free to
drop me some e-mail at:

karlm@mel.dbc.csiro.au

and I'll endeavour to reply to everyone!

Best Regards,

Karl.

----- 8< ---- CUT HERE FOR SNAPPER v0.2 TEMPLATE ----- 8< -----

```
------------------------------------------------------------------------

SNAPPER - Atari FISH Software DataBase Template

e-mail this to karlm@mel.dbce.csiro.au,
and a copy of the software as well if possible.

+-----------------------------------------+
| Release Date : Friday November 11th, 1993.|
+-----------------------------------------+

------------------------------------------------------------------------
+---------+
| HISTORY |
+---------+
```

Snapper is a DataBase of information about each of the software
packages that are available by FTP for the Atari range of computers.
It was thought that an indexing system whereby people could easily
search for particular types of software, updates of previous software,
etc. should be created. After seeing similar systems on the Amiga
range of computers, (such as the FRED FISH series), and the LSM (Linux
Software Map) for the Linux operating system, it was deemed that not
only was such a tool useful, but in light of all the different sites
around the world which are growing, it is almost a necssity. And so
it began ...

Why 'Snapper'? Well, Snapper is a breed of FISH ..... ;^)

Credits go to Erland Nagel (error@stack.urc.tue.nl) and Hermann Samso
(S_SAMSO@irav1.ira.uka.de) for getting me to do this (even though I
should have been more logical in thinking ... %@))

+---------+
| UPDATES |
+---------+

New versions of this document will be uploaded to two main sites
directly,
* The University Of Michigan Archives (atari.archive.umich.edu),
* Universiy Of Kaiserslauten (ftp.uni-kl.de)
as they are released. Updates will also be posted to the newsgroups
* comp.sys.atari.st
* comp.sys.atari.8bit
when updated.

+--------------+
| INSTRUCTIONS |
+--------------+

Firstly, when submitting, ALWAYS use the template below. Not only
does it save time for the Snapper maintainers, but it also stops us
from learning hieroglyphics, etc. ;^) Please submit all entries in
English! It doesn't matter if the english is bad, just make it
understandable. Entries in languages other than English will be
deleted.

Now the key rules.
1. Fill in as much as possible! This usefullness of this DataBase
depends entirely on how much information you can give, so fill 'em
up!
2. Don't delete anything! If you don't have anything to add in, just
leave it BLANK.
3. Also, as above, don't rename anything. If you have suggestions
for changes, e-mail me, Erlend or Hermann, and we'll try to
integrate your ideas into the next revision. Otherwise,
leave the sheet alone!
4. Once finished, e-mail the completed copy to me
(karlm@mel.dbce.csiro.au)!

5. Also, if you notice any changes or corrections that are necessary,
mark them on a copy of the template. This makes it easier for me
to understand changes, and it also aides you in trying to explain
the changes!

Thanks for putting in the time and filling out this template. Your
time and enthusiasm will help all Atari users out there, and your help
will ensure that the Snapper DataBase will continue to become a
trusted resource in the Atari Community.

Best Regards,

Karl.

Sample Guide :

Program Name : The name of the program!
Program Type : Ray Tracer, Text Editor, Sound Editor, etc.
Version Number : Revision number - i.e. v1.0.a
Release Date : The date this version was released - DDMMYY
Intended Systems : Falcon 030, STf, etc.
Minimum Requirements :
Memory : 1 Mb ST Ram, 1 Mb TT Ram
Processor : 68030, 68881
DMA-Sound : Not Necessary
TOS Version : 1.4 +
Other : Joystick, NVDI v2.5, etc.
8-Bit Prog? : No. - Is it intended for 8-bit computers?
Written By :-
Name : The Author's name
Address : Their Address i.e.

2 of the best darn adventure games I've seen for that machine (in the public domain)... I've always loved non-graphical adventure games. I still keep a fair assortment of them for the 8-bit. Although, crash dive... hmm, I may not have that one... had disk problems.

Who's all up for a massive 8-bit PD adventure game swap?!? How about we have umich create a "Adventure" directory so we can just send 'em up there for all to use? I don't mind just sharing them... heck, I've got just about every piece of software for the 8-bit - really nothing I could trade FOR!

NEED to get a hold of the "fixed" MYDOS... umm, how to describe it...hmmm.
I have a few programs (such as Atariwriter) that puke on the modified sector
count MYDOS reads back to the software. Someone once told me I just needed
the "other" version of MYDOS with the 3-digit sector count... I saw
MYDOS45M.ARC and MYDOS45S.ARC on umich, but both are the STANDARD versions.
Where can I find the "fixed" version? (what filename?)

-Tim

4306. Drive case / Black box

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-29 05:12:22 UTC
From: timuszyn@jupiter.cse.utoledo.edu
Message-ID: <CH8MGn.BoB@utnetw.utoledo.edu>
Source record: 104068

I think I need some help in this area... don't have a black box quite yet,
but was wondering how others had set their systems up.

1. Do you have a drive case for your floppy drives and hard drive(s)?
a. run off same power supply?
b. hard drive and floppy in same case?

2. If you don't use a real case for the drives, well, what do you do?
a. do you have a bare power supply sitting next to you?

3. Full/half/quarter heights all work fine, right? Any preferences?
a. brand names to avoid?

4. What's a decent sized hard drive? 100 Meg? 80? Would 40 be too small?
a. did you buy yours new or used?
b. what's a good hard drive price?
c. stick to the older drives, right? I don't want to pay top dollar for
drive performance if the old system I'm using can't take advantage of it!

5. is Bob going to have another December 'Annual' sale like last year?
(he had just about EVERYTHING discounted!!!)
- if so, this will get me to buy one soon, VERY soon... I'm keeping my
fingers crossed on this one!

-Thanks for any input
-Tim

PS: This is part of a reply I made to someone selling drive cases, thought I'd
include it just for reference... or something... on a whim I guess:

- -

Also, if you had the black box, how'd you place the hard drive (I'd assume
you would've bought one also). Could you run two half height floppies in
the double case with a full size hard drive on the bottom? Would the power
supply hold? (2 drives and the hard drive... I think it would. ???)

My ideal case would hold and power 1 360K 5.25", 1 1.44M 3.5", and some
#M (?) hard drive. I've been putting off purchasing the black box until I
find some decent drives and a case to use with it.

4307. Jaguar mailorder

Newsgroup: comp.sys.atari.8bit

Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.atari.advocacy

Followup-To:comp.sys.atari.advocacy

!The Jaguar 64bit game machine has arrived! It is packed with a
action strategy game called Cybermorph (similar to Rescue on
Fractalus) that is fun and absorbing. Keep a watch out for
DOOM from id Software and 3D Aliens versus Predator too.

Ok to get it mail order call any of these folx :

G&G Software 800-262-7462 (~$249)

J&R Music World 800-221-8180 (~$239)

The Wiz (908) 602-1950 (~$249)

Next thing to do is replace the flaky Jaguar RF modulator/cable
with the Jaguar SVIDEO/Stereo cable from Redmond Cable. Run (do
not walk) with your order to 17371-A1 NE 67th Street, Redmond,
WA 98052 (or call (206) 882-2009). Use a Sega/SNES modulator and
cable if you have to but get the Redmond cable if yu can!

Any other info about the other new consoles?

-ron

That raises a question I need the answer for: how does the 21697 Antic refresh 256k (while the 12296 only refreshes 64k)? I've looked over the original Buccholz 256k schematic (the update that performs 16k banking). There's seemingly no way for Antic to toggle the MSB (pin 1 of the 256k DRAMs). So how do you refresh the rows in the upper half of the memory? I must be missing something.

Unless you've done something wrong (??) you should be able to land on that
one planet, and complete the game. The ending is truly anti-climactic, as
it is something like "CONGRATULATIONS, YOU HAVE WON" appears on the screen,
and that endless "Anchors Aweigh" them plays once again.

Boing?! Now, I haven't played JTTP for quite a few years, but I remember being in the exact situation as John describes.. The damn planet kept teleporting away whenever I went to land on it! I tried everything... approaching from every conceivable angle, approaching slow, approaching fast, wiggling my nose while approaching, approaching while balancing on one leg and whistling "Singin' in the Rain" backwards through my nose, everything! And NOTHING worked! After what you say about the closing message, I'm almost glad I gave up. I wonder what Jeff did that John and I didn't... Any ideas, anyone?

4312. 1050 Help Needed

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-29 18:47:35 UTC
From: lmurdock@austin.onu.edu
Message-ID: <1993Nov29.184735.96583@austin.onu.edu>
Source record: 104073

Does anyone know much about the workings of a 1050? I have a busted one that I would like to get up and running. I tried to work on it a couple of years ago without any success. I am guessing that something is shorted because it causes the computer to screech and dump to basic whenver it is daisy-chained. I think it is corrupting the +5 Volt line asserted by the computer.

Does anyone have a SAMS manual (or similar) that they would consider parting with?

I talked to Brad Koda (sp?) at Best Electronics today, and he said that the
hardware is done, and the software is being done in Poland (after the
original programmer in the UK disappeared.)

He hopes to have an rtime8 replacement in early 94.

He also said someone in Santa Cruz, CA bought the rights to ICD's 8bit line,
and will be doing manufacturing only. I guess this means no upgrades, etc.
but the stuff should be available again.

Anyone else have any other rumors?

4314. New Assembler

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-30 04:11:13 UTC
From: jharris@cup.portal.com
Message-ID: <97001@cup.portal.com>
Source record: 104076

I finally have a version of my assembly language development system
available to anyone who wants it. Features include:

Excellent full screen editor with many features such as key macros,
automatic 'JSR' and return to subroutine labels, block moves and copies,
multiple undo, and XEP80 compatability.

Much of the assembler and symbol table can reside in XE bank select ram,
allowing free user memory from LOMEM to $A900.

High level of integration between editor, assembler, and debugger. The
editor can take you directly to lines that had assembly errors. The
debugger can reference labels in the symbol table.

Very user friendly -- it will save you a lot of typing.

Can also support the full 65816 instruction set, and 24 bit values.

Anyone who's interested, leave a message here or to my EMail address, and I
can send it to you as a UU encoded file.

There's some documentation included, but chances are I have forgotten to
include a few things, so please post any questions you have about the
product here.

4315. Destiny

Newsgroup: comp.sys.atari.8bit
Date: 1993-11-30 04:11:27 UTC
From: jharris@cup.portal.com
Message-ID: <97002@cup.portal.com>
Source record: 104077

Does anyone know anything about a space-type game called Destiny? I sincerely regret that I have only a bootleg copy, and was never able to find it for sale anywhere. I couldn't even find out who made it, as the internal message said only (C) 1983, but no names.

It is a game from the point of view looking out your spaceship window, ala Star Raiders. It displays some very unusual text messages that aren't even grammatically correct, and thus I wonder if the copy I have is corrupted somehow. Although I have been able to do some things with the game, I really never understood what was going on. I've always been curious about it, and I hope someone out there has had some experience with it.

Thanks,
John Harris - jharris@cup.portal.com

Anyone else hear of this? They had a product or two worth buying if I remember correctly! Heck, I'd even consider Spartados-X now that it looks like my Astra "The One" won't be my primary drive any longer! (One of the biggest bugs in Spartados... X was famous for it... limited Percomm support, and if you had an Astra, hahahahaha! Sucker! You want X to do what? Switch densities?!? hahaha! I suppose you wanted it to format working disks also! heheh...hahahahaha!) (I talked with their (lack-of-)tech support a couple years back, they were no help... it was simply a bug in their X code that they really didn't feel like they had demand to fix. Couldn't make a reliable DS/DD format with an Astra drive. Spartados 2.3 even would work with it!!! But X? Nonono.)

Sorry, had bad dealings with I(t's a)C(rummy)D(ealership). With standard drives tho, Sparta-X would be great! Post if you hear any more rumors!

I had the same problem with my file'd copy...boy I must've tried every
possible trick to land on that dodgy last planet. Piracy protection maybe?
Serves me right.

In my frustration I loaded the binary into a program I wrote
to display disk sectors as a vertical strip of graphics; in the bitmap data
I discovered an image of the man holding a balloon, vertically reading
"THE END".

Many years later I picked up the cartridge for $2 at a flea market and
finally saw the ending screen. Pretty boring, yes, but the balloon message
doesn't appear! Interesting.

Yes the graphics were crude but that was part of the charm. I loved the
atmosphere of this game; the planets felt truly alien with their garish
colors and bizarre scenarios. Much creativity packed into 16K!

Thanks for the reminiscence (and for reading my ramble.)

Message-ID: <MOR1937-291193221123@fp-phys-18-246.concordia.ca>
Source record: 104084

Hi
I'd like some info about THE DREADNOUGHT FORCE
I know that all striped ovals have to be bombed to
destroy ship, but does anyone have more info.

e.g. Is there any point in bombing out the solid black areas.
Is there some way to prevent missiles from being reset in
place. Bomb them instead of shooting ?
Does anything slow the dreadnought down ? I'd think
taking out the rockets would do it, but seems to
have no effect.
Anyone have copy of docs ?
Stan

>this a reality?

No, you're right. A robotic arm for the 8-bit was reality, well actually
it still IS reality. On the last fair in Hanau Martin Reitershan showed his
module allowing to control those "Fisher-Technik" - robotic arms.
At least here this company is called "Fisher-Technik". They DO have a
US branch with a similar (or same) name. They still sell interface boxes
for the 8-bit Atari. You just have to ask them about it.

All this stuff isn't cheap, though.

On the fair mentioned above, /HS\-Computertechnik showed up with a similar
interface. The interface was even superior to the one from Reithershan
(Fisher-Technik). It containes real relais (sp?) instead of silicon based
switches.

>So, I would like to hear of any ways to control the voltage between
>any two pins of the joystic ports. All I need is a setting above 5V
>and one lower, preferably 0V or close.

Well, for different voltage values than just 0V and 5V you'll have to
get a few resistors and build a voltage dividing array. You won't be able
to get over 5V with this of course. This would be a simple D/A converter.
You could also get an intergrated D/A converter, like the ZN426 for example.

Another idea would be to get an additional power supply and to devide its
voltage through the above devices.

The most interesting way of getting additional voltages would be a switched
mode power supply controlled by the joystick ports. Well, this would be
the most elegant way, but quite tricky I admit.

(Todd Trimble asks about joystick port use for external control.)
I am not gonna look it up, and my memory doesn't carry much detail,
but the PORTA (54016, I think) controls the joystick ports.
Get a copy of 'Mapping the Atari' and read how to control the ports.
As I remember, I did a project just to test it out and connected
two 800xls together and read back and forth between the two.
Now, if you really want me to give you some detail, leave me
e-mail. I think you set 54018 to determine how PORTA operates.

(Jeff Potter asks how the 21697 Antic refreshes 256k.)
My Newell 256k doc says the 21697 corrected a bug in the 12296
where the 12296 would refresh only 7 bits. The 21697 refreshes
all 8 bits. There is additional infromation about CAS before
RAS refresh, which is what is happening with the 12296
Antic and the extra three connections on the 256k upgrade.

4327. ATR again

Newsgroup: comp.sys.atari.8bit

Source record: 104089

Have not discovered any info on the ATR8000 w/COMPCO Z-tec 1000
HD interface.......

Nobody has one of these or knows of someone who does ?

I believe my missing link is that the drive needs to be low
level formatted. I have the SET program on a MYDOS disk
(4.01 I think) for ST225 setup. The program indicates it
is for the Z-tec HD interface. However, this is for
partitioning, and making the HD recognized. However, I
still believe I am missing a program which will format the
drive......

Any help/pointers would be greatly appreciated.

Again, the HD interface is a board (copyrighted by COMPCO)
called the Z-tec 1000. It goes between the CPU and the CPU
socket of the ATR8000, and has a 50 pin ribbon cable that runs
out of the ATR to a Xebec card which then connects to the
hard disk (the Xebec card has connection for two drives, and
only has one jumper that has two positions... don't know what
it is for either).

PLEASE ! if you know anything.... or can connect me up with
someone who knows anything about this I would greatly appreciate
it......

Anxiously waiting,

I had asked about how the various Antics could refresh the 256k DRAMs.
I found the answer in the hardware data books. The 256k DRAM has
256 rows and 1024 columns, and each row must be refreshed every 4?ms
or so. I thought it was 512 rows and 512 columns, which would have
meant that Antic must toggle A8.

Never mind :)

I remember someone asking about connecting two Atari's together, not necessarily you, James. I'll remind (whoever) that a group of us on GEnie have worked on a system (called GameLink-II) that links together multiple (up to 8 with the right hardware) 8-bit computers for the purpose of playing a networked multi-player game. We have the game working (look for it Real Soon Now), and it uses the serial I/O port, not the joystick ports. It's reliable to at least 32kbps, but the comm software must be custom written for the application.

Presuming it is a Xebec S-1410 Sasi interface card:

W1 and W2 Jumpers are for factory test, and must be installed.

W3 Jumper is for sector length ... 512 bytes or 256 bytes.
SS to 2 for 256 byte
SS to 5 for 512 byte

>

>curtis.wilbar@east.sun.com

>

If you get _TRULY_ desparate, I suppose you could bundle off the drive
to me and I could low level format it on my MS-DOS setup that uses these
controllers ... though I am in the process of reverse engineering the
drivers and format routines to adapt to a different SASI board. It may
be a month or two before I have everything laid out (time is in such short
supply) but once I adapt the routines, I should be easily able to patch
them to format the 256 byte sectors probably used by the ATR8000 (though
I could be presuming incorrectly .. check your jumper location ... if it
is already set for 512 bytes, I could format them anytime).

As I said .. it will be at least a month til my system is set up that
I could do this ... hopefully by then you will have more information
and not need such a drastic step.

the ports are really a 6520 PIA (peripheral interface adapter),
so you could also dig up the data sheet for this. If you've
got an 800 (not xl), then you've also got PORTB connected
to the joystick port as well. (PORTB is $D301, 54017 dec. -
on the xl its used for memory control).

If I recall correctly, the address line are swapped on the PIA,
so the data sheet shows port A at address 0, port A control at 1,
while the way its hooked up, port B is at address 1, port A control
is at address 2.

4333. Atari 8-bit Computers Frequently Asked Questions

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-01 18:04:02 UTC
From: MCURRENT@carleton.edu
Message-ID: <01H5YQKRKQEA9QUT7H@carleton.edu>
Source record: 104095

```
Atari Archive: 8bit/faq.txt

Welcome to the comp.sys.atari.8bit/Info-Atari8 Digest discussion group!

The 8-bit Atari

Frequently Asked Questions List

Revised 16-Nov-93

Additions/suggestions/comments/corrections having to do with this
FAQ List are welcomed by its creator and maintainer, Michael Current:
Internet: mcurrent@carleton.edu
UUCP: ...!umn-cs!ccnfld!mcurrent
Cleveland Free-Net: aa700

The 8-bit Atari FAQ List is posted on or about the first of the month to
the comp.sys.atari.8bit/Info-Atari8 Digest discussion group.

What is this FAQ List for?
The 8-bit Atari FAQ List was created to provide answers to many commonly
asked questions found in the comp.sys.atari.8bit/Info-Atari8 Digest discussion
group. At this time the FAQ List is heavily geared toward describing the
various resources for the 8-bit Atari user available, with relatively little
information on the Atari itself.
This is not an "official" FAQ List in that it is not cross-posted to the
moderated newsgroups news.answers and comp.answers. (There's no particular
reason for this, I just haven't taken the time to figure out the process yet.)
Hence no automatic archiving of this FAQ List occurs, though there's usually
a fairly recent copy on the Atari Archive (see below) as the file
8bit/faq.txt.

What is comp.sys.atari.8bit?
comp.sys.atari.8bit is the unmoderated newsgroup serving as the Usenet
side of this discussion group. All postings to comp.sys.atari.8bit
automatically appear in the Internet's Info-Atari8 Digest.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid on
comp.sys.atari.8bit.

Other Atari-related newsgroups:
comp.binaries.atari.st (ST/TT/Falcon software, object code)
comp.sources.atari.st (ST/TT/Falcon software, source code)
comp.sys.atari.advocacy (pros and cons of Atari computers)
comp.sys.atari.st (ST/TT/Falcon)
comp.sys.atari.st.tech (ST/TT/Falcon technical)
comp.sys.palmtops (includes Portfolio)
```

rec.games.video.arcade (includes products by Atari Games)
rec.games.video.misc (includes Lynx, Jaguar)
rec.games.video.classic (includes 2600, 5200, 7800)

What is the Info-Atari8 Digest?
The Info-Atari8 Digest is the unmoderated mail-list serving as the Internet side of this discussion group. All contributions to the Info-Atari8 Digest automatically appear on Usenet's comp.sys.atari.8bit. The Digest is maintained by John Dunning, jrd@stony-brook.scrc.symbolics.com.

To SUBSCRIBE or UNSUBSCRIBE to the Info-Atari8 Digest, send e-mail to info-atari8-request@naucse.cse.nau.edu.
To CONTRIBUTE to the Info-Atari8 Digest, send your posting to comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on Usenet's comp.sys.atari.8bit.
Note that any posting sent to info-atari8@naucse.cse.nau.edu will NOT be cross-posted to the Usenet side. John Dunning would like this fixed, but needs help; if you are an accomplished UNIX programmer please contact him.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid in the Info-Atari8 Digest.

Other Atari-related mail-lists:
The Info-Atari16 Digest (ST/TT/Falcon). Send e-mail to info-atari16-request@naucse.cse.nau.edu.

What is the Atari Archive?
Atari.archive.umich.edu is an Internet site which contains many files for the 8-bit Atari computers, and is part of the University of Michigan/Merit Software Archives. Our 8-bit Atari Archivists are John Dunning, jrd@atari.archive.umich.edu, and Jody Lenn, lenn@atari.archive.umich.edu. The Atari Archive as a whole is maintained by Jeff Weiner, weiner@atari.archive.umich.edu.

How do I DOWNLOAD files from the Atari Archive?
In one of four ways:
1. FTP (Try the site nearest you first.)

a) FTP to atari.archive.umich.edu (141.211.165.41) <--United States
User: anonymous
Password: [your e-mail address]
cd atari/8bit

b) FTP to wuarchive.wustl.edu (128.252.135.4) <--United States
User: anonymous
Password: [your e-mail address]
cd mirrors/archive.umich.edu/atari/8bit

c) FTP to src.doc.ic.ac.uk (146.169.2.1) <--Great Britain
User: anonymous
Password: [your e-mail address]
cd computing/systems/atari/umich/8bit

d) FTP to archie.au (139.130.4.6) <--Australia
User: anonymous
Password: [your e-mail address]
cd alex/edu/umich/archive/atari/atari/8bit

e) FTP to info2.rus.uni-stuttgart.de (129.69.8.13) <--Germany
User: anonymous
Password: [your e-mail address]
cd /afs/umich.edu/group/itd/archive/atari/8bit

f) FTP to mirror.archive.umich.edu
This address takes you to a "randomly chosen" University of Michigan/Merit Software Archives mirror site, but there's no guarantee the site you're taken to mirrors the Atari directories.

Remember to set file type to BINARY when downloading non-text files (.arc, .com, .dcm, etc.) by FTP.

2. BART - Brode's Archive Retrieval Thang - the Archive's e-mail file server
To learn about using BART to access the Archive, send e-mail to: atari@atari.archive.umich.edu. The subject of the message doesn't matter, but let the body of your message be:

help
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes), try including a line of this form:

path [your e-mail address]

BART automatically uuencodes binary files (so they may be mailed over the Internet) and splits up large files into parts of about 30K or less.

3. Gopher
The Atari Archive can be accessed in Gopher. If your system has a Gopher client, try the command "gopher gopher.archive.merit.net 70" to connect directly to the Merit Gopher server, and choose Merit Software Archives.

4. AFS
If your system has AFS capability, this is the easiest way to access the Archive. Just cd /afs/umich.edu/group/itd/archive/atari/8bit

How do I UPLOAD files to the Atari Archive?
In one of three ways:
1. FTP
FTP to atari.archive.umich.edu (141.211.165.41)
User: anonymous
Password: [your e-mail address]
cd atari/8bit/New

(No uploads may be made to the Archive's mirror sites.)

Remember to set file type to BINARY when uploading non-text files (.arc, .com, .dcm, etc.) by FTP. Also, please upload a short .text file

describing what your upload is, so our 8-Bit Archivists will be sure to place
it in an appropriate permanent directory.

Note that the atari/8bit/New directory is "write-only."

2. E-mail
This is a bit slower, but is still very effective.
Simply uuencode the file, (please split it into parts of 60 K or less)
and mail the result to weiner@atari.archive.umich.edu. Please name
the parts in the subject line. This is really helpful as the parts
usually don't arrive in the proper sequence. Also, please include a
message labeled "file transmission," containing a short description of
the file, etc. Shar files are also acceptable, but uuencoded is preferred.
It is especially important to specify that your upload is for the 8-bit
computers, since most of what Jeff receives is for the ST/TT/Falcon.

3. AFS
If your system has AFS capability, this is the easiest way to upload to
the Archive. Just cp the file into
/afs/umich.edu/group/itd/archive/atari/8bit/New

Are there any other 8-bit Atari FTP sites?
Here's another, maintained by Adam Bryant, adb@albert.bu.edu:
FTP to cs.bu.edu (128.197.2.1)
User: anonymous
Password: [your e-mail address]
cd PC/ATARI

Are there any alternatives to BART?
There are two general-purpose FTP mail-servers. These may be used to
retrieve any files available from anonymous FTP sites on the Internet,
including atari.archive.umich.edu.
1) ftpmail@decwrl.dec.com
For information, send a mail message to the above address where the body of
your message says:
help
quit
2) bitftp@pucc.princeton.edu
For information, send a mail message to the above address where the body of
your message says:
help

What is the Cleveland Free-Net Atari SIG?
The Cleveland Free-Net is like a huge public bulletin board system, and
it is the hub system of the NPTN, the National Public Telecomputing Network.
Anyone can access the Cleveland Free-Net via modem at (216) 368-3888. Those
persons with full Internet access can TELNET (this does not mean FTP) to
freenet-in-{a,b,c}.cwru.edu (129.22.8.51). Applications for free accounts are
handled online, or you may browse the system as a visitor. Once logged-in,
type "go atari" to reach the Atari SIG. Those who add their names to the Atari
SIG user directories are automatically members of the official Atari user group
C.A.I.N. - Central Atari Information Network. Send correspondence and press

releases to xx004@cleveland.freenet.edu.

What print magazines support the 8-bit Atari?

Atari Classics (exclusively 8-bit)
179 Sproul Rd./Rt. 352
Frazer, PA

bi-monthly

What product developers or vendors support the 8-bit Atari?
There are two files available:
1) "All Known World-Wide 8-Bit Atari Vendors and Developers" is part two of the 8-bit Atari FAQ List, and is posted to the comp.sys.atari.8bit/Info-Atari8 Digest discussion group on or about the 15th of the month. There's also usually a fairly recent copy available on the Atari Archive as the file 8bit/faq2.txt, or you may contact the maintainer at mcurrent@carleton.edu.

2) "The Official **AC** Vendor List" is maintained by Atari Classics magazine's Advertising Editor, Bob Scholar, r.scholar@genie.geis.com. This list focuses on North America, but all sources listed have been personally confirmed by the AC staff.

What's this UUEncoding stuff (.uu, .uue files) all about?
UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. On the Atari Archive:

Uudecode 1.2a by John Sangster - very functional. Archive filenames:
8bit/Archivers/uudecode.bas - just ENTER this into Atari BASIC
8bit/Archivers/uudecode.doc - the User Manual

Yet Another UU-coder by ?John Dunning? - both decoding/encoding. Filename:
8bit/Archivers/yau.arc - contains both yau.com and yaue.com.

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use." Filename:
8bit/Utilities/uue.arc - contains uudecode.com, uuencode.com.

Dumas UU-coder by John Dunning - should work w/BART-style split files. Fname:
8bit/Cc65/dumasuu.arc - contains uud.com, uue.com, CC65 sources.

What is an .arc file?
A file with the extender .arc has been archived in a standard manner that is common in the MS-DOS world. This is done to make the file shorter, so it takes up less space on your disk and it takes less time to transfer between computers. The Atari Archive contains several 8-bit Atari archivers fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended. Filenames:
8bit/Archivers/superarc.arc - both Super Un-Arc and Super Arc
8bit/Archivers/suprarc2.arc - just Super Arc
8bit/Archivers/supunarc.com - an un-arc'd copy of Super Un-Arc
8bit/Archivers/supunarc.uue - uuencoded copy of supunarc.com

Okay, how about a .dcm file?
A .dcm file is a format unique to the 8-bit Atari which is used to convert entire disk images into files. To work with .dcm files you'll need:

Disk Communicator 3.2 by Bob Puff. Archive Filenames:
8bit/dskcom32.arc
8bit/Archivers/diskcomm.arc

Can I read/write 8-bit Atari disks on an IBM-PC?
There are several programs on the atari.archive of this variety. Note that most require a DOS and disk drive on the Atari end capable of the SS/DD 180K format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs are:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
8bit/Diskutils/atario21.arc

Mule by Rick Cortese - Reads/Writes SS/ED 128K Atari disks. Very limited.
8bit/Diskutils/mule.arc - includes Atari Mule; Action!, Turbo C sources
8bit/Diskutils/mule.exe - IBM Mule
8bit/Diskutils/mule.txt - descriptive blurb

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks. Filename:
8bit/Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Quite popular.
8bit/Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

What's the best DOS for the Atari?
This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2D is disk-based; SpartaDOS X is cartridge-based and includes many additional features. While it's hard to argue that SpartaDOS X is not the most advanced DOS available, it is a commercial product that is no longer manufactured. MYDOS, on the other hand, is a shareware product that continues to be improved upon.
It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. MYDOS is available at the atari.archive.

What are the best telecommunications programs available for the 8-bit Atari?
Here are some of the more popular PD/shareware terminal programs available on the Atari Archive:

BobTerm by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Archive filename: 8bit/Telecomm/bterm12.arc

Kermit-65 by John Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Archive filenames:
8bit/Telecomm/k65v37.arc - the latest version
8bit/Telecomm/k65doc.arc - the documentation
8bit/Telecomm/k65src.arc - the source code

OmniCom by CDY
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Archive filename: 8bit/Telecomm/omnicom.arc

VT850 by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: none
Autodial: No
Archive filename: 8bit/Telecomm/vt850b1.arc

What hardware has Atari created in the 8-bit computer line?
Computers:
400 (1979) 8-16K, membrane keyboard, 400/800 OS
800 (1979) 8-48K, two cartridge slots, 400/800 OS
1200XL (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL (1983) 16-64K, BASIC, PBI, XL OS
800XL (1983) 64K, BASIC, PBI, XL OS
800XLF (????) ?????, a U.K. variety...
65XE (1985) same as 800XL minus PBI
130XE (1985) same as 65XE with 128K plus ECI
800XE (1987?)same as 130XE but only 64K. Mostly eastern Europe.
XE Game System (1987) same as 65XE plus Missle Command, detach. keybd.

Peripherals:
410 Program Recorder (Japan and Hong Kong versions)
810 Disk Drive SS/SD 90K with DOS 1 or DOS 2.0S, MPI&Tandon vers.
820 Printer (40 col.)
822 Thermal Printer (40 col.)
825 Printer (80 col.), req. 850
830 Modem (300 baud acoustic, req. 850, with Telelink I)
835 Modem (300 baud, with Telelink II)
850 Interface Module (4 9-pin serial, 1 15-pin parallel ports,
beige & black metal versions)
1010 Program Recorder (Sanyo and Chelco versions)
1020 Printer/Plotter (print/draw in 4 colors)
1025 Printer (7-pin dot matrix, 80 col.)
1027 Printer (80 col., letter quality)
1029 Printer (7- or 9-pin??? dot matrix)

1030 Modem (300 baud, with 1030 Express!)
1050 Disk Drive (SS/ED 128K with DOS 3 or DOS 2.5)
XC12 Program Recorder
XM301 Modem (300 baud, with XE Term)
XMM801 Printer (80 col.)
XDM121 Printer (80 col., letter quality)
XF551 Disk Drive (DS/DD 360K with DOS XE)
XEP80 Interface Module(80 col. video display and DB25 parallel port)
SX212 Modem (1200 baud, rarely with SX-Express! package)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 2 x SS/DD 180K with DOS 2.0D
1064 64K RAM module for 600XL
1090 XL Expansion System, for PBI, CP/M/MS-DOS/Apple II compatible
XM128 12" green monitor w/ built-in 80-column card
XC1411 composite 14" color monitor
XF521 5.25" floppy drive - 1050 compatible, in XE style
XTM201 non-impact printer
XTC201 non-impact color printer

Where is my nearest 8-bit Atari BBS?
The "ATARI CLASSICS Atari Bulletin Board System listing" is maintained
by Lawrence Estep, AC's Telecommunications Editor, 71450.1050@compuserve.com.

Where is my nearest 8-bit Atari user group?
An 8-bit Atari user group listing is maintained by Atari Classics
magazine's Exchange Editor, James King. [e-mail address needed]

: "For he who shall combat me with paint shall forever be my friend,
: not my enemy."

It turns out that this is easier than you think. When I was a Junior
in high school, a friend and I built a robot and connected it to my
130XE for a Science Fair project. We built the robot arm from a
Robotix kit (a kinda modern erector set) and built the interface for it.
We got our information from a Bits & Pieces article from Analog (or Antic,
or whoever carried that series). The article told how to program the
joystick ports for output, and also provided a few simple circuits that
would control real world devices. Our project had 4 (I think) separate
motors that we controlled. This provided our arm with four axes of
motion. One moved the entire arm left and right, one moved the entire
arm up and down, one rotated the "wrist", and the last one worked a claw
to grab objects. The software was also very simple. We wrote a basic
program which POKE'd the appropriate addresses, and then we made a
demonstration program. We would activate the motor for a certain
amount of JIFFIES and then turn it off. This provided a very precise
method of moving the arm even though the robot was built with low
precision motors.

...a little reminiscing.....(ahhhh, the good ole days....)

Yup, I thought that was pretty impressive at the time. Like I said,
with a little electronics experience, it is actually pretty simple.
I don't remember if I still have the Bits & Pieces article, but I

can check. Unfortunately, my friend kept all of the robot parts, and now he no longer uses his Atari.

Speaking of projects like this, I want to know about the one where you connect you joystick port to your body, and use it as a lie detector. (Another Antic or Analog project, I think.) It was supposed to be simple, and a friend told me that it was even pretty accurate!

enough worthless babbling on my part...

4336. Atari 8-bit computer items for sale

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-01 19:56:21 UTC
From: cohen@GOMEZ.phys.virginia.edu
Message-ID: <009765E2.B2A9DD40@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 104098
Cross-posted to: comp.sys.atari.8bit,misc.forsale.computers.other

The following "stuff" (hardware, software, books) will be sold to best
(reasonable) offer. Please pick up any items you are interested in,
there is NO need to buy everything!
Please e-mail offers to COHEN@BORN.PHYS.VIRGINIA.EDU , or call (804)293-8973
late evenings in case you have no e-mail account (prefer e-mail, please).
I will respond to every e-mail message I get here (if you get no response,
please try again).

Thanks!

***** HARDWARE *****

Except where otherwise notes explicitely, all hardware was in working condition
when used last (I no longer have the Atari computer to test it now).
When problems are known to exist, details are given.

Computer- Atari 600XL, with power supply and video cable; no manuals.
Works fine!

Printer- Star-Micronics SG-10
(Centronics parallel standard interface, for use with Atari
850 unit and parallel cable sold below or equivalent)
Monitor-
1. Monochrome monitor, composite video, no sound, excellent for
80-column work, text-intensive applications and BBS. Picture on
this monitor is MUCH sharper than any color monitor will provide.

2. Color monitor- Amdek 13", with composite color video and audio
inputs. In excellent condition, picture and sound are excellent.
Asking for offers of about $75 (or more ? :-)

Atari CX853 16K RAM memory module for Atari 800
Axlon RAM CRAM 32K memory module for Atari 800
Modem cable (to any RS232 modem) for Atari 850 unit
Parallel (centronics) printer cable for Atari 850 unit
Atari 1027 Letter Quality printer almost new, in original box, with manual,
but does not work properly
Atari 1020 color printer/ plotter with manual.
Another Atari 1020 Color Printer/plotter with manual, this one need work
on print spool
Atari paddles

Joysticks- various types and shapes, all tested and working well.

Atari remote control joysticks (of the type sold for the 2600 system,
with a base unit and two remote hand-held joysticks).

Atari 1030 Modem with manual
Taihaho Direct Connect 300/450 baud modem model TH-003 autodial/auto answer
(I think this connects to the joystick port)
Atari 410 Program Recorder (the original one).
Atari 1010 Program Recorder - Works fine.
Atari 1010 Program Recorder - save: ok, load: no. Main unit only, without cables

Atari 400 computer- sold as-is, gives no picture on the TV screen.

***** SOFTWARE *****

Cartridges-
==========
BASIC (CXL4002) with manual

Disks- (All are original disks)
======
TimeWise with manual and original box
Sargon II with manual and orginal box
Music Construction set with original binder and manual
Pinball Construction set with original binder and manual
Atari Translator
Atari program Exchange (APX) ATSPEL/AT.WRIT.-program 1.0, by R.S. Kistler
Atari program Exchange (APX) ATSPEL/AT.WRIT.-dictionary 1.0, by R.S. Kistler
Atari DOS 2.5 with manual

plus about 50 generic disks with shareware, and many types of programs
(word processors, terminal emulators, utilities of all sorts, games, etc.)

Cassettes-
==========

Joystick Sketchpad with manual (new, sealed)
apx Eastern Front 1941 (with manual and original box)
Thorn EMI Compute 4 and Reversi (in original box with instructions)
Atari Statistics I (with manual and original box)
Atari States and Capitals (CX4112)
Atari Hangman (CX4108)

Books-
======

Bill Carris- Inside Atari BASIC
ICD SpartaDOS Construction Set
Your Atari Computer
Computers for Kids- Atari edition
Albrecht, Finkel and Brown- Atari BASIC- XL Edition
COMPUTE!/Richard Mansfield- Machine Language for Beginners
Atari BASIC Reference Card for Experienced Programmers (Atari, 1983)
An Introduction to the Atari DOS 3 (Atari, 1983)

Please e-mail offers to COHEN@BORN.PHYS.VIRGINIA.EDU , or call (804)293-8973
late evenings in case you have no e-mail account (prefer e-mail, please).

I played with the lie detector project a bit. It came from an Antic (I don't know which one, but I know I have it in my stack of Antic's). All you had to do for that one was open up one of the paddle controllers and connect a couple simple electrodes to the terminals of the pot. I could never get it to change the display too much when I messed with it. Pretty neat though.

4338. Atari 800 Fu@kin Awesome!

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-02 01:07:40 UTC
From: olso0001@gold.tc.umn.edu
Message-ID: <olso0001.754794460@gold.tc.umn.edu>
Source record: 104100

I just went back to my parents house for Thanksgiving and I found
my Atari 800, I brought it back with me to college and it is THE BEST. I
have an Amiga 1200 and the 800 is even better than that .

REASONS WHY IT IS THE BEST :

1)It is brown.
2)The name Atari is on it.
3)The disk drive goes "Bwrauawn!" when you load stuff
4)double awesome cartrige port thing.
5)Cool system reset button

if anyone else has reasons why the 400 800 or maybe even the 1200 are the
best please post them.

Oh yeah the 400 is also the best because when you type it makes the same
noise as the top of a Very Fine fruit beverage. "nyt neyt"<-- You know

If anyone knows where I can get a modem and some term software for my 800
I would GREATLY appreciate any information. I have got to get a modem so I
can upload some games I made when I was 8 to the various FTP sites. I have
a totally generic game named RUBY hunt that I made in basic.

Daniel B Olson-1 (olso0001@gold.tc.umn.edu) wrote:
: have an Amiga 1200 and the 800 is even better than that .
Well, if I remember right, they were designed (the chips at least) by the
same person...

: REASONS WHY IT IS THE BEST :

: 1)It is brown.
Takes stains well, keyboard has taken severe water pressue/damage...
someone mentioned about a good 6 months ago that they spilled pop into the
keyboard and just hosed it out... still works fine.

: 2)The name Atari is on it.
Could've hidden it... wouldn't matter too much I guess.

: 3)The disk drive goes "Bwrauawn!" when you load stuff
And will scream and make other loud, scary noises if you turn off the drive
(810) prematurely then turn it back on.

: 4)double awesome cartrige port thing.
Too bad it wasn't used for more than a few cartridges!

: 5)Cool system reset button
Can be fooled, but is handy.

: if anyone else has reasons why the 400 800 or maybe even the 1200 are the
: best please post them.
The sound capabilities of the old 400 and 800 is better than the 1200 and
other XL's and XE's... fuller, more of a rich organ-like sound. You REALLY
have to hear it!

: If anyone knows where I can get a modem and some term software for my 800
: I would GREATLY appreciate any information. I have got to get a modem so I
: can upload some games I made when I was 8 to the various FTP sites. I have
: a totally generic game named RUBY hunt that I made in basic.
: olso0001@gold.tc.umn.edu

If you're serious, watch this newsgroup... some frequent users are selling
some older equipment. There are a few hawks/vultures also... not really bad,
but they buy whole systems from newcomers trying to sell off their old 8-bit
equipment and then sell each component for a much higher profit... sometimes
they'll ask as much as what they paid for the whole system! You can find them
quite easily: check for some 8-bit equipment list sale or somesuch subject...
There are about 3 or 4 I can think of off hand! They're not all that bad
though... if you REALLY need some piece of Atari equipment, ASK them! They'll
probably be able to get it for you!!!

-Tim

4343. 8bit Hardware/Software for Sale

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-02 04:43:54 UTC
From: kmajkut@netcom.com
Message-ID: <kmajkutCHE556.E0J@netcom.com>
Source record: 104103

My parents finally decided to sell their house and made me clean out
the basement of my old hardware and software. I just don't have
the time/space/etc to deal with it. I have the following items
that I'd like to sell, preferably as a set. The one catch is that it's
in Connecticut and it would be much easier on me to have someone pick
it up, but it can be shipped if absolutely necessary. Enough spewing,
just send me some mail and we'll talk about it...

2 Atari 800 computers w/48k each. 1 is Atari memory, 1 isn't.
One has 'Impossible'.
2 1050 Disk drives. 1 works, 1 doesn't.
1 1030 300baud modem.
1 410 Cassette recorder.
3 or 4 power cables.
3 or 4 Atari joysticks.
1 set of paddles.
1 Printer Adapter(Uprint A16)
Some misc interface cables.

Compute Books:
Machine Language for Beginners
Book of Atari Graphics
Books 1,2,3 of Atari
Your Atari Computer:A guide to the ATari 400/800
Atari Basic
Mapping the Atari
Atari 1050 Field Reference Manual

Carts:
Robotron
BASIC
Kickback(I don't remember what this is)
AtariWriter

Software:
Infocom-Ballyhoo,Infidel,Wishbringer(all in boxes,etc)
Many other pieces of software. Mostly arcade games and
infocom games. No boxes, no doc. Uh, I don't remember where
I got these...

Misc junk like an 800 cover and 2 5.25 disk holders(Flip N' Files).
I think that's about it. Like I said, it's all in CT, but I'm open
to discussion. Oh, I also have an Epson LX80 NLQ(Near Letter Quality)
Dot Matrix printer that I used to hook up to the 800. It's in
Californmia though. I can easily ship it or throw it in.

send me a note and we'll figure something out.

-Keith

: this a reality?

No, you're quite right! They came out with original plans and stuff in an old A.N.A.L.O.G. Computing I think... REALLY old, first or second year I think! (I could be wrong, might have been Antic. (?)) Anyone want to check their old issues for it? I have second year forward buried somewhere, one or two first year I think.

As for the arm, it was INCREDIBLY EASY! In fact, I've seen plans for using the 800 to control a home-security system, turn lights on and off in your house at different intervals, etc.! There were plans for the old AUD/DIG converter attachment, speech recognition hardware and software, you name it, it was probably tried on that old workhorse!

-Tim

PS: Anyone interested in some AU clips I made years back? A bit choppy, nothing like the 22kHz WAV samples possible now, but still not bad! Re-wrote my own software, etc. Forget who originally came up with the idea...Ed something... oh-well!

For Sale:

* 1 meg, Atari 1040STe w/Rimik

* Magnavox ICM-435 14" color display w/stereo sound and tilt/swivil stand
(only 4 months old)
* Supra 45 meg Hard Drive w/DMA and SCSI thru ports

* Rimik Beatle Mouse

* Epyx 500 XJ Precision joystick

* Fitted 1040ST Dust Cover

Included & Pre-installed software (just some of the many, many titles):

* NeoDesk 3.0 w/NeoDesk CLI
* Word Writer 2.0
* Deluxe Paint ST
* Dungeon Master
* Their Finest Hourt
* Copy II ST
* DEGAS Elite
* Flash
* DB Master
* GFA BASIC 3.5e Upgrade
* Gunship
* STar Wars
* Joust
* Neochrome Master
* Arkanoid II
* Guild of Theives
* Major Motion
* A-Copy 1.2
* Tetris
* and over 100 additional games, applications, and disk utilties including some r are and
one-of-a-kind programs (never commercially released, ect)
* Atari ST Internals book
* ST Gem Programmer's Reference book

All items are in great condition.

I'm asking $675 (US funds) or best reasonable offer for the whole thing. I'll even pay
shipping (in the continental US) if I can sell it prior to Dec. 10, 1993.

This is a great system folks - reliable, cheap, and even more compatible with existing software than the Mega STe and Falcon.

Please direct all decent offers and/or inquires to me at my e-mail address:

feldak79@snyoneva.cc.oneonta.edu

Thanks,

Ari Feldman

[chopety chop]
You should include the XL and XE models in that list.....
the Atari 8-bits are the best......'cos they are.....'nuff said.......
Power without the price.... says it all realy, outstanding graphics, sonics power...all sorts of clever tricks you can get up to (DL's, DLI's,VBI's,etc) and sooooo easy to use.................
Yeah only the best for me - and the only micro I own is an Atari 8-bit (all 4 of them :)).

To whoever it was that said that the developers list hadn't been posted recently you should check your newsfeed, 'cos I saw it on the 15th of last month (perfectly on schedule). Great work Michael :)

Yeah Yeah! But I've got a STOCK 1050! :(Oh well, I did my report in
windows and on the school's Macs... Hope I get a good grade tho - one of
those last min. things <gulp>... :)

Switch!? What switch!? I supposedly have a RAMboXL 256 in my 1200xl but it has no switches! Man, I'D like to have two power switches for my XL - one for main CPU & RAM and the other for the other 192k RAM :)

Is that like what it is? Or is it some on/off switch that only works while the machine is on.. or is it for ANTIC?

Hmm.. I don't remember where I got my copy - I think it was on a disk that
someone sent to me and the three versions if MyDOS I have are:

MyDOS 4.53/4 - newest version with 4-sector count <-- I use this one
MyDOS 4.53/3 - newest version with 3-sector count
MyDOS 4.50 - older version with 4-sector count

Ooh! You mean now everyone can get a copy of Action! !? :)

EVERY programmer needs a working copy of Action! to screw around with, it's
by far the best high-level language out for the Atari with Quick coming in
next, and, well, I dunno about C, but I'm not really excited about get any
C compiler for the 8bit. I'll stick to a 16+ bit platform for that..

The 800XL my friend had with a RAMBO XL in it had a switch in the back that allowed him to change (while the computer was off of course) between the standard 800XL and the RAMBO. (maybe his was RAMROD XL, hmmm...sorry best I could do!)

From: korpela@mofo.ssl.berkeley.edu
Message-ID: <2dls0p$6lm@agate.berkeley.edu>
Source record: 104126

I've inherited a broken 800XL with a 1050....

The memory test says that the first ROM is bad. :(Does anyone have a broken 800XL with a good ROM that they'd be willing to pull out and send me?

Seeing that the system was in pieces, I wasn't too surprised to find the 1050 was missing its power supply. Does anyone know what the input voltage/current is?

I also have no disks for the thing. Is there a way to write the disk image that comes with MYDOS onto a disk using my IBM?

Thanks much!

Eric

Message-ID: <2dn41b$3rn@dux.dundee.ac.uk>
Source record: 104136

As I am typing this on a SPARC station 1+, and not my 800XL, i'm afraid I haven't a clue how to do anything except

a) Send individual mail to people
b) Post notices like this

As you may have guessed, I haven't a clue how to transfer files between the two machines :(

So the only way I can send a copy of the Atari User program is to type it in and send it as a message. Fortunately it's a five-liner, i'll just have to be careful when I type out all those machine code data statements (yuk!)
(It doesn't say what pins to connect though- that's why I posted the message about connecting Ataris in the first place, but someone has mailed me offering to help as far as this is concerned).
I'll post it in this newsgroup on Monday for those interested, that is if I remember (cos I'm selling my Amiga A500 Plus at the weekend - i'd *never* sell any of my Atari equipment, 'cos they're worth more to me than anyone else. Of course, this means i'll be using my Atari even more now!)

Graeme Fenwick

4377. Making an atari emulator

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-03 19:12:15 UTC
From: David Hanley <U22015@uicvm.uic.edu>
Message-ID: <93337.131215U22015@uicvm.uic.edu>
Source record: 104141

Well, I have decided I really do want to make an atari 8-bit emulator.
Crazy of me? Perhaps. I don't think naking the basic program will be very
hard:

1) Write a 6502 emulator that will use a 64K array as memory.
2) Copy the atari ROM into the correct place in the array.
3) write a handler to handle the display list interrupt
4) handle the keyboard interrupt.

And we will have a virtual atari computer, albeit one that cannot
talk to the outside world, for example, to load disks.

Would this be wasting my time, I.E. has this been done before?

What are the legalities of this, particularly copying the atari ROM?

And, a key thing, would others be interested in participating in this
project? My idea is that different groups/persons would each work on
a different element. One would write the 6502 emulator, one would write
the display list handler, one would write the sound drivers, etc,etc.

This would all be in C/C++ for sevral reasons, one of the primary ones
being portability.

Well?

dave

4378. Re: New Assembler

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-03 20:46:04 UTC
From: jharris@cup.portal.com
Message-ID: <97350@cup.portal.com>
Source record: 104139

>Does it include a list of 6502 assem. commands? :) Im a BEGINNER at this ..
>hell, I havent actually STARTED :)

No. The docs that come with it are probably not sufficient for someone who has not used an assembler before. They were written with the intent that the user would already have some experience.

However, I do beleive that this assembler is easier and more enjoyable to use than other products out there. (Less biased rebuttals to this are welcome). If you can find a book on 6502 programming, something I would recommend in any case, this assembler should work fine for you. I'm always available to answer questions too.

John Harris - jharris@cup.portal.com

What you're looking for is a FREEZER switch.. I recently installed just a swtichin my 1meg Newell - and let me tell you, its GREAT.. Now I can do a COLD boot
on my Newell one meg and keep my ramdisk intact!

4382. Uploads to Umich

Newsgroup: comp.sys.atari.8bit

Well.. Being the SysOp of Delphi's 8-bit Atari database has its advantages.

Keep an eye on the Umich 8bit Atari NEW directory, as I'm currently in the process of doing some MAJOR batch uploading of Analog games, utilities, etc.. . not to mention the regular hard-to-find PD stuff that is being included as well.

Let me know what you think!

My compliments!

Ahh! Newell! You said the magic word! Looking for some info on the Newell mods... Upgraded OS, accelerater, etc.! What type do you have installed on your system? I was thinking of going with the ... umm, can't recall the name now... the C.S.S. modified OS, but anyhow: the Newell sounds a bit better, and quite interesting! How hard are they to install? Did you have the company do it for you? I received a catalog (2 page flyer) about a month or two ago and it was VERY vague. What can you recommend? How much did your mods cost? Ramrod? Ramrod XL? They have a few other chips/OS's also, not sure what to try... NEED INFO BADLY! Their improved "performance stats" sound promising (heck, I'd love to double my processing capability on my 800 or 800xl for that matter), but I have no one to refer to...

help!!!
-Tim

PS: 1 MEG Newell? Any additional power requirements? I remember about 5 years or so back, 1 Meg could be tried, but they couldn't guarantee stability since the chips ate too much power. I assume as technology increased, power consumption leveled off a bit???

: windows and on the school's Macs... Hope I get a good grade tho - one of
: those last min. things <gulp>... :)

Ugh... too bad you didn't have a modem... could've transferred it over the lines rather quickly. How big was the finished paper? 10-20 pages of text doesn't take too long, even at 300 baud. If you have a modem for your stock system (Atari end), do you need a transfer program for it? If so, what do you need? Quite a bit's accessible at umich... and if not, I could probably send a copy of what might not be! (I never did see a working, executable version of kermit "up there".)

-Tim

4385. no mail!

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-04 11:48:30 UTC
From: djg0@aber.ac.uk
Message-ID: <13041.9312041149@thor.dcs.aber.ac.uk>
Source record: 104147

As you may have read on the net, my old email address at aber.ac.uk has now
expired. DO NOT send any email. I will never get to see it!

I hve an acconunt on freenet, but unfortunately, I set up mail re-direction
from freenet to the aber account, so the mail will just dissappear again if
you send to freenet. At the moment, I can't get }ionto freenet to take
mail re-direction off again. Also, it is almost impossible to get onto
freenet during the week (even when I
log on at 7am UK time which is roughly 2 am machibene local time). This
will mean that I will only be able to send and read mail once a week from
now on. If I can't get onto freenet
this weekend to change the re-direction,
then I will have to wait another week.

my new email address will be dx107@cleveland,.freenet.edu. However, D
DO NOT send email to this address until I give the all clear.

Dean Garraghty.

KAMARO_KID@delphi.com wrote:
: the process of doing some MAJOR batch uploading of Analog games, utilities,

Yes! Good to have another helping the stash! I was planning some bulk u/l'ing of Adventure games this weekend... Talked to Jody about it already too. We should have an Adventure subdir soon! How's about helping in the adventure game area with me? I've got a dozen or two, but I'm sure I'm missing a few here or there! I was also planning on sending along a short descriptor file... something like adv-list.txt or somesuch. This way at least ONE directory on umich will have a descriptor-index file! (Anyone entering the directory need only grab the couple-sector (maybe 1-5k max) text file to see what adventure game files are available for d/l.)

Let me know about the descriptor file idea... sound decent? If you choose to hold off adventure posts for now... maybe another area of "expertise" could be started, say "STRATEGY"???

YEAH!

4388. SOURCE CODE FOR THE EMULATION OF THE 6510/6502C ON A PC

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-04 14:12:00 UTC
From: freddy@frederik.toppoint.de
Message-ID: <5EDe3X6g_YB@frederik.toppoint.de>
Source record: 104150

Hi guys !

I thought some of you might be interested in the source code for the
complete emulation of the 6502 processor (which is fully compatible to the
6502C as far as I know) on a PC. The listing as such was taken from the
C64-EMULATOR (MS-DOS) which has been available for quite a while now.
Now that all of you have the source listing we can expect a ATARI 8-BIT
emulator on the PC real soon (I hope :^)).

If you have any queries please feel free to send me a message.

Yours ATARIly,

Ulf Petersen

PS: Please send PM to freddy@frederik.toppoint.de

4389. OK to send me mail now!

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-04 17:48:00 UTC
From: dx107@cleveland.Freenet.Edu
Message-ID: <9312041747.AA26246@nextsun.INS.CWRU.Edu>
Source record: 104151

Hello again!

OK, I've sorted out the mail on freenet, so you can
now get me at: dx107@cleveland.freenet.edu

Don't forget that I will only be able to read/send mail
once a week at weekends. If I don't reply straight away, then
I'm not ignoring you!

Dean Garraghty.

4390. Re: Uploads to Umich

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-04 17:49:51 UTC
From: KAMARO_KID@delphi.com
Message-ID: <931204.46191.KAMARO_KID@delphi.com>
Source record: 104152

I too uploaded a TEXT file along with each program I sent to UMICH.

I was up until about 3am last night uploading to UMICH..

All tell, I think I sent about 40 files to Umich in 3 batch uploads.

I'd be interested in your adventure directory.. I run a BBS here in Utah and have about 5 meg of 8bit Adventure games.. Basic, ML, etc..

4391. Scott Adams PD?

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-04 18:27:41 UTC
From: ind00052@pegasus
Message-ID: <2dqkqt$gvc@pegasus.cc.ucf.edu>
Source record: 104153

Someone mentioned to me that the old Scott Adam's games have been released to the public domain as of a few years ago. Does anyone know facts on this? I have 1-12, which could be put at the archive if true. Unless assuming PD versions were released for other platforms, or someother way differing. Anyway...

Sen
ind00052@pegasus.cc.ucf.edu

4392. Re: Making an atari emulator

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-04 20:40:23 UTC
From: aek@wiretap.spies.com
Message-ID: <CHJ2rB.6wL@wiretap.spies.com>
Source record: 104154

From article <93337.131215U22015@uicvm.uic.edu>, by David Hanley <U22015@uicvm.uic.edu>:
> Would this be wasting my time, I.E. has this been done before?
>
> This would all be in C/C++ for sevral reasons, one of the primary ones
> being portability.
>
> Well?
>
There are a bunch of 6502 CPU emulators floating around the net in C and
x86 assembly language. Emulating the ANTIC and POKEY's is the tricky part.

Unless you are running the emulator on a very fast processor, you'll also
be disappointed with a simulator's performance (interpreted simulators as
a rule of thumb run 10 to 20 times slower than the processor they're running
on)

4393. icd mio to hard drive connection

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-04 23:09:12 UTC
From: ernster@cobra.uni.edu
Message-ID: <1993Dec4.170912.20209@cobra.uni.edu>
Source record: 104005

I have an ICD MIO hard drive interface with an adaptec 4000A interface tha i would like to connect to a miniscribe 3425 or 3650 hard drive to run from my 8-bit system. I need to know how to get one of these drives to read and write the 256 byte sectors required by MIO. I've tried calling technical support with no luck. I have also tried ICD bulletin board but no one there responds to my messages. Any help would be greatly appreciated.

4394. WANTED: 850 or equivalent and 850-Express

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-04 23:19:33 UTC
From: dgb@owlnet.rice.edu
Message-ID: <CHJA4M.JBn@rice.edu>
Source record: 104010

I'm looking for an inexpensive (~$20) 850 interface or equivalent
(P:R: Connection?) and the 850-Express modem software.

This needs to work on an Atari 800 with unmodified 810 drive.

4395. Atari VCS question (Sorry!)

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-05 00:57:20 UTC
From: wiz@apple.com
Message-ID: <wiz-041293184706@17.127.11.102>
Source record: 104006

I know this group is for Atari 8 bit computers, but I'm hoping that someone here will be able to help. I'm looking for a device that will read the contents of a VCS cartridge.

Several years ago, one of the electronic project magazines described how to build a device that would let you dump the contents of a Atari cart to a cassette tape. If anyone remembers this or has any info on the above, including cart pin outs, a response would be greatly appreciated.

Well, you could write scottadams@aol.com and ask him. He just might say
putting them on the archive is fine. Unfortunately, this is not the
Scott Adams who wrote the games, but the Scott Adams who is the car-
toonist behind the Dilbert comic in your local paper, and taking his
advice on this just might not be the right thing to do. :-)

4397. Re: icd mio to hard drive connection

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-05 03:11:27 UTC
From: rdell@cbnewsf.cb.att.com
Message-ID: <CHJKv3.83M@cbfsb.cb.att.com>
Source record: 104008

In article <1993Dec4.170912.20209@cobra.uni.edu> ernster@cobra.uni.edu writes:
>I have an ICD MIO hard drive interface with an adaptec 4000A interface tha i
>would like to connect to a miniscribe 3425 or 3650 hard drive to run from my
>8-bit system. I need to know how to get one of these drives to read and write
>the 256 byte sectors required by MIO. I've tried calling technical support
>with no luck. I have also tried ICD bulletin board but no one there responds
>to my messages. Any help would be greatly appreciated.
>

According to my Adaptec manual, sector size is set up in software by
the formatting routine. No jumpers on the board for that, detailed
specs on setting up drive parameters.

Jumpers on Adaptec board:

A-B |
C-D | 3 bit scsi address A-B lsb to E-F msb
E-F |

G-H DMA transfer rate --- in SYSCLOCK/4 out DATACLOCK/2
SYSCLOCK/4 is slower for single sector transfers
where necessary for controller ... multi sectors always
at fast rate.

I-J Extended command set

K-L not used

M-N Support for drives that drop SEEK COMPLETE when switching heads

O-P Self Diagnostics

R-PU Write Precomp turned off for both drives

R-S Write precomp starts at reduced write cylinder for both drives

R-T Write Precomp all tracks on both drives.

The R jumpers are only on the 4000A, and not on the 4070A, and override
any software setting in the mode command.

If you want to know the details of the specific commands sent over
the SCSI bus to format the drive, let me know, but be aware that won't
help you unless you can hack into your formatting software, or roll
your own.

I REALLY doubt this is true, as they are still sold. In fact, I think
American Techna-vision sells the disk of 1-12 (ONE DISK) for $12.50! For
that price, it doesn't hurt to get the originals, THEY ARE SIMPLY INCREDIBLE
for those who've never played one. All text, but most are well thought out
and play in a few hours max.!

4400. ADVENTURE LISTING

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-05 08:22:03 UTC
From: timuszyn@jupiter.cse.utoledo.edu
Message-ID: <CHJz8s.Azt@utnetw.utoledo.edu>
Source record: 104013

Slowly starting a massive Adventure game upload to umich. Sometime soon, you'll be able to find these files in the Adventure subdirectory, but for now they'll be in New. Sorry to say, these may not be the best adventures I have for the Atari 8-bit, but there's a couple that are decent. I hope to send all or virtually all of my adventure archive to the site, but for now, these 11 will have to do. Give 'em a try and let me know what you think!

Note: all files will be arc's except: general.idx and advent.idx

general.idx is a sample format file I hope a few people MIGHT follow when uploading. It's basically the BARE minimum of info that people would like to have on any given file. For those very curious:

Newell Industrys is still in buisness and selling all thier Atari 8 bit
upgrades for VERY reasonable prices. I dont know the # offhand, but
they are in Wilie, TX and i know the # is available from directory assistance.

How hard are they to install? Did you have the
>company do it for you? I received a catalog (2 page flyer) about a month or
>two ago and it was VERY vague. What can you recommend? How much did your
>mods cost?

Ramrod?

My ramdos (3 os board w/o any o/s's) cost $19 as i recall, though it may be
less now.

Ramrod XL? They have a few other chips/OS's also, not
>sure what to try... NEED INFO BADLY!

Get the OS/NXL os for sure, its super fast and includes an EXCELLENT
breakpoint 6502 debugger and assembler by David Young IN ROM.

They also sell the Omni80 OS w/ an 80 column os built in.

Their improved "performance stats"
>sound promising (heck, I'd love to double my processing capability on my
>800 or 800xl for that matter), but I have no one to refer to...

4402. $20 bundles

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-05 15:07:19 UTC
From: dx107@cleveland.Freenet.Edu
Message-ID: <9312051507.AA26025@nextsun.INS.CWRU.Edu>
Source record: 104014

DGS Clearance bundles

==========

We are having a clearout at DGS HQ, and HAVE to get some stuff out of the way because we keep tripping over it! In order to get the stuff out of the way as fast as possible, we have decided to sell it in bundles and as cheap as possible. We now have *2* of the following bundles to dispose of:

****

ATARI MACRO ASSEMBLER, EASY PROGRAMMING FOR THE ATARI MICRO BOOK, DIGI-STUDIO (OLD PACKAGES 1&1.5. ALL SOFTWARE EXCEPT THE NEW LIDS SYSTEM - 2 DS/SD DISKS AND 2 MANUALS), ONE BACK ISSUE OF EITHER PAGE 6 MAGAZINE OR ATARI USER (THE BRITISH MAG.) OF OUR CHOICE.

All the software is BRAND NEW, except the mags which are used.

PRICE: JUST $20 PER BUNDLE

===

THIS PRICE INCLUDES SURFACE MAIL SHIPPING FROM THE UK! (THE PARCELS WEIGH IN AT 1.2 KILOS SO AIR MAIL IS NOT REALLY A VIABLE OPTION. IF YOU WANT YOUR BUNDLE SENT BY AIR MAIL THEN ADD $15 TO THE PRICE).

****

Ordering info:

First reserve a bundle by email: dx107@cleveland.freenet.edu. I only read and send messages from here once a week at weekends. I'm not ignoring you if I don't reply straight away!

Then send US$20 in cash direct to us at DGS. Paying in cash is the easiest way to pay. You can pay by IMO if you prefer but these cost a fortune to arrange. If paying by IMO, then make it payable for 10 UK pounds.

Our address is:

DGS

62 THOMSON AVE

BALBY

DONCASTER

DN4 0NU

ENGLAND

Note: It is important that you send your $20 as soon as we confirm that a bundle is still in stock. We need a rapid turn-around on this stock. Only reserve one if you REALLY want one. We have had problems in the past with people reserving stock and then never paying for it.

Note 2: please note our address now. We won't give it again when we confirm your reservation by email.

We will put your bundle in the post the same day your $20 arrives. Delivery by surface mail should take about 6 weeks to the US. Delivery by air mail takes about 1 week. We will also throw in a copy of the latest DGS catalogue of PD and commercial software.

Dean Garraghty.

5 December 1993.

I forget the issue number, but next time I'm back at school (which should be Monday) I'll try to find it. It is Radio Electronics, I think.

The project consisted of building a Z80 based computer that would map its memory to the cart space of the VCS.

I was thinking about doing a similar project with an Atari 8-bit, but just haven't had the time. Thankfully, I graduate in 12 days!! (In music education if anyone knows of any openings.) So I might have some more time to follow this idea.

Later,

4405. HARD Demo...

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-06 00:57:00 UTC
From: Dag.Hugdahl@tdkt.mn.org
Message-ID: <755190512.AA05875@tdkt.mn.org>
Source record: 104024

Just checking, but has anyone else had any problems with parts of this demo? I have a RAMBO XL and the first couple of demos on each side load and run correctly, but when it gets to demo #3 on the first or demo #2 on the second side, the computer locks up. Both demos start to execute, but both just stop dead. This looks like a great demo and I would love to see the rest. Any ideas?

Atari 130Xe 8-bit computer --

This machine is a fully color and sound capable machine. Its great for games and some more advanced word processing / DTP. It can use a common TV set or composite computer monitor for its output. This machine would make a great gift for any child (young or not-so-young) or the beginning / novice computer user. The best part is all the various software I have for it... 100's of games and utilities.

I will guarantee this machine to fully work upon receiving it. I will help you set the machine up, get it fully working, and answer any questions you may have about it for as long as you own the machine.
***

HardWare:
- Atari 130Xe small footprint 8-bit 6502-based computer w/ manuals
- 20MB External HD w/ interface card
- Atari 1050 External 180k floppy drive
- Atari 1027 LQ printer (Impact)
- Skeoska AT-100 printer (dot-matrix)
- Atari XM301 300 baud modem (Non-working)
- Two Atari joysticks

Software and Manuals:

Applications:
- Atari Writer Plus w/ manual
- Bank Street Writer w/ manual

Language:
- Atari Basic w/ manual
- Basic Programming Game book
- Atari Assembler w/ manual
- Low-level (Hardware) programming manual (huge!)
- Kayan Pascal w/ manual

Misc:
- SAM (speech software) w/ manual
- Music Construction Set
- Carina BBs I and II
- Antic BBs
- SpartaDOS
- MyDOS 4.3A
- Amodem

Games:
- Honestly.. 60+ disks (both sides) Packed with LOTS of great games, utilities..etc

- Castle Wolfenstein
- Ace of Aces w/ manual
- Racing Destruction Set
- Flight Simulator
- Ultima IV w/ manual

Cartridges:
- DigDug
- RiverRaid
- Tank
- Asteroids
- Wizard of Wor
- Star Raiders
- Jumpman Jr.
- Assembler
- Defender

==========

The machine *IS* missing the main Atari 130Xe power supply and the power supply for the Hard Drive. This isn't a problem and we can work this out since both parts are readily available and I'll ship it fully functional.

If your interested in the computer, please e-mail me at dranch@ecst.csuchico.edu.

Thanks!

4409. MYDOS 4.53

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-06 03:34:33 UTC
From: timuszyn@jupiter.cse.utoledo.edu
Message-ID: <CHLGLM.AGB@utnetw.utoledo.edu>
Source record: 104021

Ok, well it seems a few of us know WHAT version of MY-DOS to get for 3-digit sector counts, etc. But no one knows WHERE to get it!?! Is it available for d/l on a BBS somewhere in the country? Can we write the author? Is it a "registered" version of MY-DOS only? How much? What versions of DOS do most of the Atari users out there use? I use MYDOS 4.50 currently, but have to fall back on DOS 2.0 for Atariwriter. (I could use MACHDOS, but I'm getting spoiled by that darn ramdisk!)

Missing: have you seen MY-DOS 4.53?
- report its whereabouts to your local authorities!

-Tim

4410. Re: RAMBO XL Help

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-06 04:00:01 UTC
From: KAMARO_KID@delphi.com
Message-ID: <931205.82801.KAMARO_KID@delphi.com>
Source record: 104022

I installed my 1meg Newell myself. Not too difficult, about 15 wires soldered, 2 dozen or so ram chips stacked ontop of one another with pin to pin solder connections and a mini-board to control it all.

Other than being time consuming and detailed, its not incredibly difficult.

I highly recommend the Newell 1 meg upgrade - other than the BASIC disable switch which allows for the total 1meg ramdisk (with switch off you get 320k AND basic).

The freezer switch just tops it all off - as a crash allows for complete recovery of my ramdisk.

4411. Re: Connection of an XL and XE (the J: driver program)

I will post the joystick port driver here soon, but it'll depend how long it takes me to type the thing in (the instuctions are longer than the program).

If anyone gets Atari User, it is published in the August 1987 issue on page 22. (The full assembly code is there as well).

Message-ID: <9312061351.AA06878@cs.utexas.edu>
Source record: 104028

I would like to announce a new part time company called 8-BIT GOLD, being launched today dedicated to bringing you the Atari 8-bit enthusiasts products that have long since disappeared and even some new products that are still in the making.

So far there is only one product available but within the next week or so there will be two re-releases of some classic games.

The product already available is the Yorky 256k plug in upgrade for the Atari 800/600XL computers. This memory upgrade simply plugs into the PBI and gives you 256k of bank switched XE compatible memory.

Current price is #50 (UK pounds) plus shipping.

We are currently working on several additions to the standard Yorky unit, these include
i) Battery backup facility
ii) XE compatibilty (which it doesn't have at the moment)
iii) In built printer interface
iv) PBI feed through port for addition of other PBI peripherals

You will be advised if/when any/all of these addons become available.

The two games shortly to be re-released are:

1) JAWBREAKER inlcuding a second maze which has never been commercially available.

2) MOUSEKATTACK the original version with no updates! Sorry!

Both of the games will be available on disk initially priced at #4.95 plus shipping, and may become available on tape (both standard & RAMBIT turbo formats).

We also have several more games in the pipeline - more details will be released when we are closer to their completion.

If there are any software authors out there with products finished or nearly finished we would be very happy to consider marketing them. This applies to new software and old games so long as you have the rights to them.

For more details write to:

8-BIT GOLD, 79 SPROTBROUGH ROAD, SPROTBROUGH, DONCASTER, DN5 8BW, ENGLAND

or e-mail RG9@UK.AC.YORK.VAX or RG9@UK.AC.YORK.TOWER

(for those outside the UK you may have to invert the uk.ac.york.xxxx)
(part to xxxx.york.ac.uk)

Telephone enquiries can also be accepted over the weekend period from 7pm on friday evening to 4pm on sunday afternoon.

In the UK phone (0302) 784642, outside the UK refer to your phone book on how to dial internationally!

Richard Gore (Manager and owner of 8-BIT GOLD)

Thank you, but now I have a problem. How do I get the file from Umich
to my 800? I'm guessing the only way is to download it to an Atari.
Well, it seems I don't have any way of accomplishing this with my current
set-up. Anyone have a suggestion that I haven't thought of?

Can someone please explain the differences between
the Atari 5200 and 7800.
I'm hoping to buy one for my grandson, but can't
remember the difference between them.
(Anybody have one in good condition to sell,
preferably with tons of games ?)
Stan

4416. Local Atari User Group Meeting - Wed Dec 8/93

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-06 18:30:59 UTC
From: daroloso@math.uwaterloo.ca
Message-ID: <CHMM3n.Gz9@undergrad.math.uwaterloo.ca>
Source record: 104023
Cross-posted to: ont.micro,kw.micro,uw.sys.atari,comp.sys.atari.st,comp.sys.atari.8bit

In December, the Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST)
Atari user group will have a general meeting.

Our 16-bit library currently has over 400 disks of public domain
and shareware software.
In addition, there will be our updated catalog disk and our
disk-of-the-month.
Our 8-bit library is also available at this meeting.

As well as our own newsletter "The Hard Copy", we hope to also give
attendees the November issue of AtariUser.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Room opens at 7:00 pm. Meeting starts at 7:30 pm.

Wednesday, December 8, 1993
DCS Course Room, Room 2009 (2nd floor)

Call 725-2068 for more information.

Hope to see you there,
Dani Roloson

4417. Atari 8bit hardware wanted!

I am looking to find another Atari 800 and either an 800xl or a 130xe.
Also, I'm looking for an 810drive and a 1050or higher drive (can be
Happy). Atari original joysticks are always welcome as well as
a good Basic Cart.
I also need a couple of good quality composite color monitors.

4418. Connecting PC and 800XL by modem?

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-06 19:37:31 UTC
From: brian.morgan@sdrc.com
Message-ID: <5200@heimdall.sdrc.com>
Source record: 104025

I have a DOS PC with a modem, and an 800XL with a modem. Is there a way
to hook the two modems directly together to communicate, without going
thru the phone company? I don't have a serial port on the Atari,
otherwise I'd use a null modem cable.
Thanks,
Brian

4419. Info on "antique" monitors sought

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-07 00:28:25 UTC
From: splite@bambi.sdd.trw.com
Message-ID: <2e0in9$gvf@deneva.sdd.trw.com>
Source record: 104035
Cross-posted to: comp.sys.ibm.pc.hardware.video,comp.sys.apple2,comp.sys.atari.8bit

I bought a couple used monitors (without docs, of course) and could use some info.
One is a Taxan 620U. Looks like a color composite, has some dip switches in the
back for setting color palettes, etc. It has a DIN-8 connector for the video
cable. Anybody have a pinout for this? I'd like to use this thing on my Apple
//e, or with an old CGA card.
I also have an Epson MCH-4095E. Looks like a mono-- maybe Herc compatible? Has
a DB-9 connector on the video cable. Tried it with a EGA adaptor, but no luck,
so I'm guessing it's MDA/Herc. Any info on either monitor would be appreciated.
Thanks in advance.

Huh... well, looky here! Sounds great! The ram upgrade sounds like a
great offer, but I have an upgraded 800xl already. What I'd LOVE to see is
a low cost ram upgrade for my 1200xl or my old 800. If you plan on marketting
one in the near future, I'd DEFINITELY be interested! (The sound on the old
800 was a bit better... I kind of miss the old tank!)

Jawbreaker and Mouseattack... actually I think I have Jawbreaker, but I
might be interested in this. Heck for $4.95, sounds like a GREAT deal!
Now, is this 4.95 in U.S. dollars or were you referring to the british pounds?

Well, even though I own an 800XL, I've never tried this with an Atari and IBM.
However, I have done this many times with two IBMs. I've only done it with
Hayes compat modems and here's how (sometimes takes some playin' to get it to
work):

Type at to make sure that modems are responding ok.
Type ath0 on one modem and ata on the other. They should connect.
If they don't, try making one dial atdt 1 and the other ata. (You may have to
shut off dialtone checking on the dialing modem). If that doesn't work, you
might try ata on one and ato on the other.

Good Luck

All right! I've heard of that darn Apple II emulator years back!
I WANT IT! I've looked, but it's been IMPOSSIBLE to find! It allows
a basic Atari computer to emulate the old Apple II... nice! From what
I hear, the graphics weren't bad! I'd wager it's because the Apple's
really weren't capable of good high res graphics... and the Atari
didn't have to work hard to beat that part.

Either way, PLEASE SEND THIS TO THE ARCHIVE! I'd be VERY interested
in giving this a try! If I recall, this was the same author who wrote
the old Commodore emulator!!! You could select what computer you wanted
to emulate from the main menu, then it would load a bare-bones emulator
from disk! Quality programming! Saw it somewhere in 1986/7/8...
sometime long, long ago, in a place far, far away...

Message-ID: <2e1q5r$inn@dux.dundee.ac.uk>
Source record: 104041

This is the "J:" driver I said i'd post. Unfortunately, I don't yet know
enough about the system, or have the neccessary equipment to transfer an
Atari program to the binaries file, so here it is...

JOYSTICK DRIVER by TIM RODGERS

This listing originally appeared in the August 1987 edition of ATARI USER
(the old one).

The instructions here are a slightly shorter version of what originally
appeared, but nothing important has been left out.

"This program allows you to treat the joystick ports as any other
I/O device in five lines!
The device name is "J:", and is used in this manner

OPEN #S,N1,N2,"J:"

S is the stream number 0-7
N1 is set to 4 for input, 8 for output and 12 for both.
N2 should be set to 0 EXCEPT when N1 is set to 12 (both input and
output). It is the decimal equivelant of the binary bit pattern
for setting the direction of the individual I/O lines, so if it is
is set to 15, then lines 0,1,2, and 3 will be output and 4,5,6, and
7 will be set to output. (Bits are set for output, and reset for
input).

Remember to SAVE the program before running as it erases itself when
it runs.

Commands

PUT#S,X - sends the byte X to the port
GET#S,X - gets the byte from the port.
CLOSE#S - Closes stream S

And this is the program itself......

Basic Program :-

```
1 FOR I=1536 TO 1649:READ D:POKE I,D:NEXT I:L=USR(1536):NEW
2 DATA 104,162,0,189,26,3,240,10,232,232,224,36,176,3,76,3,6,0,169,74,157,26,3,232,169,36,
157,26,3,232,169,6,157
3 DATA 26,3,96,50,6,95,6,104,6,98,6,110,6,110,6,76,85,6,165,42,201,12,240,11,201,8,240,25,
201,4,240,26,160,146,96
4 DATA 166,43,169,56,141,2,211,142,0,211,169,60,141,2,211,160,1,96,162,255,76,70,6,162,0,7
```

```
6,70,6,76,91,6,141,0
5 DATA 211,76,83,6,173,0,211,76,83,6,160,146,96

End of Program

This is the GET IT RIGHT! checksum (looks like it uses the earlier version).

Line Checksum
-----------------
1 10645
2 16707
3 16526
4 16287
5 7027

There is also a listing of the assembly language, this is in the magazine.

-------------------------------------------------------------------------

Thanks for the suggestions from people regarding the neccessary pokes, it's
a shame I wasn't able to download .gif files on this machine (a SUN), 'cos
someone offered to mail me a scanned page referring to this.

And if would like to know what wires you're supposed to connect where (and in
particular for connecting two machines, my original posting), i'd likeo to know what they
were too! The program said it referred to Len Goldings articles in Atari User,
so the answer may be there- if I find it i'll post another article (who said
"Oh no not another"??) saying how I got on. Can I take it however, that the
handler requires both ports to be connected, since it is 8-bits (a single port
can't handle that many can it)? Anyway, hopefully i'll have it worked out soon.
(Oh look! A flying pig! ;-)

4433. 8-Bit Gold Update!

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-07 13:42:54 UTC
From: RG9@VAX.YORK.AC.UK
Message-ID: <9312071342.AA10791@cs.utexas.edu>
Source record: 104044

Well 8-BIT GOLD got off too a great start yesterday, the only reply I had was from the programmer of the two games pointing out a couple of errors in my post. So I will now correct these;

1) The two mazes on Jawbreaker have been available before however they were sold as separate packages and shipped at different times, now you get both mazes on one disk as well as a bonus!!

2) Mousekattack and Jawbreaker both have improved joystick controls and so are easier to control than the first versions.

3) Jawbreaker now has a pause command.

I hope that clears up any confusion!

Now payment details, I will accept payment in US dollars or UK pounds, in all future postings prices will be quoted in both US dollars and UK pounds with shipping charges also detailed. I am quite happy to ship to any country in the world by airmail (so long as they are not on the United Nations embargo list!).

Prices for the games are #4.95 in the UK (shipping included)

or for outside the UK #8.00 or $13.00 (shipping included).

If you have e-mail it might be possible for me to e-mail you the software at a reduced price and it is then your responsibility to get it from your host machine onto an 8-bit disk. Of course the software is still copyrighted and may not be passed on to other people. If you are interested in such a system please let me know and I'll see what can be arranged.

E-mail RG9@UK.AC.YORK.VAX or RG9@UK.AC.YORK.TOWER
(outside the UK reverse the uk.ac.york.xxxx to xxxx.york.ac.uk)

or write to:

4434. Re: MYDOS 4.53

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-07 14:24:08 UTC
From: potter@sunny3.DAB.GE.COM
Message-ID: <CHo5C9.EzL@sunblossom.ge.com>
Source record: 104048

Okay, people have been complaining about locating MyDOS 4.5 with 3-digit sector counts. It's a simple change, right from Bob Puff himself:

After booting up with MyDOS 4.5, and BASIC installed, type in the following:

```
POKE 5268,24
POKE 5269,144
POKE 5270,14
```

Then go to DOS and choose the "Write new DOS files" command (don't write over your one and only copy, obviously). Don't try this with any other versions of MyDOS.

Hope this helps!

The 7800 can play games that were made for the 2600. Supposedly, there was a 2600 adapter for the 5200, but you'd have a hard time finding one now. The 7800 has newer games than the 5200, since they stopped making the 5200 in the mid-80s, and the 7800 has only been discontinued for a year or two.

4437. 1450 XL(d)

Newsgroup: comp.sys.atari.8bit

Has anyone heard of these following Atari 8-bit machines
1450 XL
1450 XLD -with drive
(I am quite sure they are called that..)

What happened to them? They looked like great machines at the time.
I have seen one of them years ago at a computer show but the guy wanted 300.
00 for it at the time(worth 150.00).
Bill

4438. J: and driving things

I would suggest calling the various vendors (if they are still in
business). Most vendors are willing to send you copies of important
information for free (so long as they can use a copier to do a page
or two). If they have to send you a manual, then they can charge as
much as $10.00. However, try to stress that you do not want the entire
manual and you should be ok.
.

: POKE 5269,144
: POKE 5270,14

Perfect! This should do just fine! Any known problems with this
modification though? You can run a small hard drive partition, etc. ok
with a modified version, right? (I need to mix and match a 4 and 3 digit
DOS with the HD once I get it and set it up... certain programs I currently
use will not work with the 4-digit version, but others will... I'd like to
make some drive partitions as big as I can!)

: Hope this helps!

(definitely... a great deal!)

Thanks!

Karl Meyland (karlm@highett.mel.dbce.csiro.au) wrote:
: Hi there everyone out there in Net-Land!

: Well today, after many problems (mainly finals ...) I release the
: first official copy of SNAPPER. A few of us (Erlend, Hermann and I)
: have noticed that there is a sad lacking of an information system to
: find out what software is available for the good old ATARI range of
: computers by FTP, so we created a project called SNAPPER. SNAPPER
: is/will be a database of all the software we can find for FTP'ing.
: The database is similar to the FISH index on the AMIGA (bleurgh ;^))
: and the LINUX operating system. By compiling a database of what is
: available, we hope to aide those "I've need of a XXXX type program.."
: requests, and to ensure that people can always get the latest
: software versions. A brief synopsis is in the file itself, as are
: the instructions. We welcome all your comments, suggestions, praise!?
: and hope that everyone will participate in the project by filling out
: entries for us.

: Well that's about it, If you have problems, whatever, feel free to
: drop me some e-mail at:

: karlm@mel.dbc.csiro.au

: and I'll endeavour to reply to everyone!

: Best Regards,

: Karl.

: ----- 8< ---- CUT HERE FOR SNAPPER v0.2 TEMPLATE ----- 8< -----

: ------------------------------------------------------------------------

: SNAPPER - Atari FISH Software DataBase Template

: e-mail this to karlm@mel.dbce.csiro.au,
: and a copy of the software as well if possible.

: +----------------------------------------+
: | Release Date : Friday November 11th, 1993.|
: +----------------------------------------+

: ------------------------------------------------------------------------
: +---------+
: | HISTORY |
: +---------+
```

: Snapper is a DataBase of information about each of the software
: packages that are available by FTP for the Atari range of computers.
: It was thought that an indexing system whereby people could easily
: search for particular types of software, updates of previous software,
: etc. should be created. After seeing similar systems on the Amiga
: range of computers, (such as the FRED FISH series), and the LSM (Linux
: Software Map) for the Linux operating system, it was deemed that not
: only was such a tool useful, but in light of all the different sites
: around the world which are growing, it is almost a necssity. And so
: it began ...
:
: Why 'Snapper'? Well, Snapper is a breed of FISH ..... ;^)

: Credits go to Erland Nagel (error@stack.urc.tue.nl) and Hermann Samso
: (S_SAMSO@irav1.ira.uka.de) for getting me to do this (even though I
: should have been more logical in thinking ... %@))
: ---
: +---------+
: | UPDATES |
: +---------+

: New versions of this document will be uploaded to two main sites
: directly,
: * The University Of Michigan Archives (atari.archive.umich.edu),
: * Universiy Of Kaiserslauten (ftp.uni-kl.de)
: as they are released. Updates will also be posted to the newsgroups
: * comp.sys.atari.st
: * comp.sys.atari.8bit
: when updated.
: ---
: +--------------+
: | INSTRUCTIONS |
: +--------------+

: Firstly, when submitting, ALWAYS use the template below. Not only
: does it save time for the Snapper maintainers, but it also stops us
: from learning hieroglyphics, etc. ;^) Please submit all entries in
: English! It doesn't matter if the english is bad, just make it
: understandable. Entries in languages other than English will be
: deleted.

: Now the key rules.
: 1. Fill in as much as possible! This usefullness of this DataBase
: depends entirely on how much information you can give, so fill 'em
: up!
: 2. Don't delete anything! If you don't have anything to add in, just
: leave it BLANK.
: 3. Also, as above, don't rename anything. If you have suggestions
: for changes, e-mail me, Erlend or Hermann, and we'll try to
: integrate your ideas into the next revision. Otherwise,
: leave the sheet alone!
: 4. Once finished, e-mail the completed copy to me

: (karlm@mel.dbce.csiro.au)!
: 5. Also, if you notice any changes or corrections that are necessary,
: mark them on a copy of the template. This makes it easier for me
: to understand changes, and it also aides you in trying to explain
: the changes!

: Thanks for putting in the time and filling out this template. Your
: time and enthusiasm will help all Atari users out there, and your help
: will ensure that the Snapper DataBase will continue to become a
: trusted resource in the Atari Community.

: Best Regards,

: Karl.

Wow! A 2600 adaptor for the 5200?!?!? This would mean you could use it
on the Atari computers as well! I was shown in GREAT detail, that the CPU
in the 5200 and the Atari computers COULD NOT perform some of the tricks the
2600 and 7800 used to fool their CPU's for some "repeat" graphics. If they
came up with an adaptor to "fix" this, I need to know for sure - I'll hunt it
down until I find one!!! I want a couple 2600 games for my Atari Computer!
For example, there was never a game like Raiders for the 2600 on any computer
I've ever run across. (Temple of Doom was a port of the video game of the
same name BTW.)

From: cb541@cleveland.Freenet.Edu
Message-ID: <2e3ero$k4s@usenet.INS.CWRU.Edu>
Source record: 104156

(In reference to J: device from August '87 'AtariUser', posted
here.)
I played with the listing for J: device. I hesitate to say it
doesn't work. I got far enough into it to see that it installs
itself incorrectly, I fear. It increments only two bytes for the
handler table, which has three byte entries. After I modified
the code with another inx and adding one to the jmp
instructions, I used a joystick port cable I made earlier to
attempt to read/write between two Ataris. I couldn't get it to
work. Now, I've thought of making the joystick ports into a
serial device, like the MPP handler does and have previously
played with it. This handler is too small to be implementing a
complete rs232 serial device, so maybe it is supposed to be a
parallel device. I dunno.
A serial device would only need xmit and recieve and gnd to
be simple. The cts,rts and other stuff aren't absolutely necessary.

From: brownan@vax.sonoma.edu
Message-ID: <1993Dec7.194434.1@vax.sonoma.edu>
Source record: 104158

Hello out there, I have a question about percomm data drives.

I got a percomm single desity drive that was given to me, and it is
set up as drive 1, but I couldn't find any switch, and I really would like
to change it to drive 2 so that I could use my double density 1050 as
drive 1. is there anyway to do this? I would really appreciate it.

thanx in advance, anthony

ps, please email me with a response at either the address from this message,
or at anbrown@husc.harvard.edu

4447. Bunch of STUFF

Newsgroup: comp.sys.atari.8bit

Are these programs PD (or shareware, etc): Atari Oil, Bacterion Flak (Antic), Masters of Time (if not who makes it?).

Does anyone know where I can find a copy of VanGuard, especially one that works on a 130XE - I'll buy the cart if I can find it.

What was the game where you put coins in a jukebox and the robots would dance and you had to collect coins (or something) and a popcorn machine made popcorn. Did this game exist, or am I hallucinating?

Sen

It's not exactly an 'adapter'. It's a complete 2600. The later 5200s
brought video and audio to the cartridge port, expressly for the
2600 add-on. If I remember, you need seperate controllers for it as well.

May as well get a VCS.

Unfortunately, this "adaptor" is just a complete 2600 that uses the 5200
as a slave unit to hook up to the TV. It didn't actually emulate a 2600
but was a 2600. Kind of a bummer but true.

Where was this demo written? If it was written on a PAL system then the code
could be overuning the shorter VBI's on NTSC systems....

You're going to have to open the case and change the drive select on the drive itself. Are you familiar with drive jumpers?

|> scramble the VTOC?
|>
|>

Tim,

There's no problem with compatibility between the 3-digit version and the 4-digit version. Those 3 pokes I listed only change how MyDOS (mostly DUP.SYS) interprets and displays the sector count. The VTOC entries are identical. The entries in sectors 360 to 367 (?) are identical. So you can create files in one version of MyDOS, read them in the other version, modify them, change versions, all without problems. As you've probably found out, large files or large free sector counts (>999 sectors) are displayed in some odd way (I forget just now).

Programs I have found that insist on 3-digit sector counts include the MultiCopy program (C. Johnson?) and the AMS (Advanced Music System). I'm sure there are more.

>(I am quite sure they are called that..)

I believe you are talking about the 1400XL and the 1450 XLD. The 1400 XL had an internal 300 baud modem, and function keys, as well as speech processor. The 1450 XLD was the same, but with a built in 5 1/4" floppy drive.

>What happened to them? They looked like great machines at the time.
>I have seen one of them years ago at a computer show but the guy wanted 300.
>00 for it at the time(worth 150.00).

Well, as is true with a lot of Atari stuff of the past, it was vaporware. They never made it to market. Just a few beta machines existed, but were never in full production. Oddly enough, the drives in the 1450XLD were supposed to be true Double Density, unlike the 1050's density and a half. it was also touted to be double sided. Basically it was the XFF551! five years earlier!

Hopefully that should get some attention :) I'm working on an Amiga version of the (rather useful) SIO2PC/AFS software, and I'd like some feedback on how it should be implemented.

I still haven't been able to get the two ICs for the actual SIO2PC cable, so this is purely at the concept level at the moment, but this is how I think I'll handle it:

- The disk data will be stored as a single file on the Amiga end, as raw sectors. This means you will be able to copy practically anything to it (it probably won't handle copyprotection too well, though), format it, etc.

- The connection to the Atari will be handled by a background process (possibly a commodity, with a nice popup UI :), hopefully using the serial.device (so's to be nice to the system).

- Some kind of handler will enable the Amiga to read the data file as a normal DOS device. (Not quite sure about how to implement this part at the moment, but I have a few ideas. Suggestions welcome :)

At this stage, what I need to know is whether anybody can see any problems with the setup, has advice, etc... And if anyone's interested at all, of course :)

Also, don't excpect it to be out any time soon. I probably won't even have a working cable before February :(

The apple II emulator I was talking about is for IBM clones. CHeck
out the FAQ on alt.emulators.ibmpc.apple2. Are you talking about
an emulator for the 8-bits or for the ST, anyway? I vaguely
remember some rather mediocre Apple II emulator for the ST from about
'86...

Compare Karateka on the Apple II to the Atari 8-bit version. You will
be surprised to find that the graphics on the Apple version are
slightly better (more color, in fact!). I suspect that the Atari version
is a port of the C64 version- graphics and all. To get in the extra colors
in GR. 7 1/2 they would've had to use player-missiles or/and DLIs, which
would've taken more work and more skill.

Brent

4461. Yes-- there will be an Atari emulator

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-08 23:06:43 UTC
From: feb6399@ultb.isc.rit.edu
Message-ID: <1993Dec8.230643.12479@ultb.isc.rit.edu>
Source record: 104174

I've noticed that recently there have been a number of posts
about working on a new Atari emulator.

Well, I don't know if anyone remembers anymore, but back in
August I wrote an Atari emulator for Xwindows, but I was never
able to complete it because I ran into a few bugs which took
more time than I had, and then I went away for the last two
weeks of August, and have been taking far too many classes here
at RIT since I came back...

However, this week I started looking at it again, and fixed it
up a bit, although I'm still tracking down the CPU bug I had,
which I think is related to decimal mode (since some games that
work perfectly in other ways have mangled characters for the score,
and BASIC doesn't work)

So, my first question is: does anyone have detailed info on
exactly which instructions are affected by decimal mode (I
assumed only ADC and SBC) and the exact effects on all the
flags, and how they are different than a normal ADC or SBC?

I could swear I'm doing it right, but some of the Apple 6502
emulators I found did it slightly differently, so I tried their
way and now the code runs even worse, so I don't know what's right.

So, as before (back in August) any help would be appreciated.

Thanks.
- Frank "shaggy" Barrus
(feb6399@ultb.isc.rit.edu)

4462. Re: Yes-- there will be an Atari emulator

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-08 23:08:28 UTC
From: feb6399@ultb.isc.rit.edu
Message-ID: <1993Dec8.230828.12572@ultb.isc.rit.edu>
Source record: 104173

Whoops...
In the previous post I mentioned my problem, but didn't
tell what I did have or what I intend to do with it....
Well, as before (back in August) I support all of
the video modes (except the GTIA 16color modes, but I'll
have them soon) and properly interpret the display list
so as to do DLI's, etc...
Also, player-missile graphics *with* collision
detection... about the only thing I don't support is sound
and the peripherals. (although I recognize the output
to the serial port and print the data so the program
can coninue normally-- it just thinks nothing is hooked
up--- I load binaries with a built in mini-dos)
I've also got these cute mini-joysticks at the bottom
of the window and the ability to simulate paddles
or koalapads with the mouse.
My big problem is speed--- I'm running on
a 386/33 under Linux and through X-windows, and my
emulator only runs at about 20% of full speed, although
on faster systems you should be able to approach full
speed. (although if the display is constantly doing fine-scrolling
it slows to about 5-10%)
In order to speed it up, I took all my nice general
CPU and hardware structures and functions and started making
everything global so I didn't have to pass parameters and
I started making a ton of #define's with code to effectively
inline everything. This helped a lot although it made the
code a mess...
So....
What I was wondering was--- how many of you who
would be interested in this have access to a good C++ compiler?
With C++ I can write code that is at least as efficient,
if not more so (in speed, that is-- memory might get used
a bit more though) but is much cleaner, since every CPU
and hardware component can be made into a separate class
but when the code is put together they can all be inlined
to make it fast. (and maybe I'll catch my bugs better too)

So would anyone object greatly to having it written
in C++ instead? I mean, for those that don't have a C++
compiler, maybe someone else could build it for you, or
convert it to C or something?

If enough people have problems, I'll leave it in
ugly C code, otherwise I'll convert it and clean it up.

(another advantage: multiple Atari's could be simulated
at the same time easily with C++ and could be set to talk
to each other to set multi-system programs-- my original C
code could do that but not after the optimizations I made)

Let me know.

- Frank "shaggy" Barrus
(feb6399@ultb.isc.rit.edu)

p.s. ---
I will release this to the net as soon as the code
is cleaned up a little with the major CPU bugs fixed.
Other optimizations and features will be added later
as time permits.
(which isn't much, since I'm also working on
a portable operating system project)

>I'm assuming that they are the original programmers of MouseAttack
>and JawBreaker? Or have somehow bought the rights, or what's the deal?

Yes, they are pretty much the original programs. I made some improvements to the joystick control routines of both games, added a pause to the original Jawbreaker which did not contain one, and included the both 1st and 3rd maze styles on the same disk. The 2nd style, which some of you may have seen, was simple and rectangular, and was never intended to be shipped. There may also be an additional bonus feature.

Mousekattack may look like an ordinary maze game, but the cats really do offer some unique game play, especially with two players.

>By the way, I think there was a JawBreaker Construction Set released some
>time ago.

I never saw this. I'd be interested to know what it is.

|> to the 800XL ?

Recently I have looked into this (just a tiny bit!) - it seems possible.
If you have any information on cheap, available LCD displays, let me know.
I have seen B.G. Micro advertise ones for $19.95 lately, but haven't gotten
up the courage (or the spare time) to just order one on the hopes of
making it work. You'd most likely have to get into the guts of the GTIA
output (before all the nastly analog stuff), and provide an additional power
supply (some need -12V). Even so it might only work with custom drivers.

Anybody out there have docs they can send me?

THE ATARI CLASSIC PROGRAMMER'S CLUB

Address: Pen-Tyddyn
Capel Coch
LLangefni
Anglesey
Gwynedd LL77 7UR
Wales.

Email: MBITDC9306@newi.ac.uk

The following details are taken from the club's information sheet ...

ARE YOU AN ATARI 8-BIT PROGRAMMER?

You are? Then have we got news for you!

The Atari 8-bit range of home computers are undoubtedly amongst the finest ever designed. Faster than a Commodore 64, better graphics than a Spectrum (then again, what hasn't) and a larger colour palette than any other 8-bit ever designed bar the ill-fated Enterprise. So, if it's such a good machine, why isn't there anyone producing software for it?

Well, apart from the obvious piracy problem the 8-bit has always had, there is no real reason. After all, piracy was just as rife on the other 8-bits yet they haven't suffered with a lack of software in the way Atari users have been doing. Most of the big software houses, particularly in the UK, have ignored the Atari over the past few years ... but with the help of The Atari Classic Programmer's Club, that could well change!

We believe that there is a wealth of top class programmers around for the Atari somewhere, but it would seem that they need help and encouragement to get them on their way. So, what can we actually do?

NEED HELP? NO PROBLEM!

From our own personal experiences, we find that programmers begin with what is often an excellent idea which is then halted in its tracks by one of several things:

a) Design - This is the first and probably most important stage of program development. Get this wrong and the whole framework of the project falls around your ears. Some designs are simply not viable and many of these can be pinpointed straight from the start. Other problems involve a program that is going well, the design is being followed to the letter and then ... Whammo! A major snag is hit as the playability of the game becomes suspect and the whole project has to be shelved. It saves both time and money if such failures in a

project design are pinpointed before programming begins.

If you have a programming project design that you are unsure of, feel free to send it in for evaluation. We may then be able to make our own suggestions as to how to improve the overall design.

b) Graphics - This is often the bane of inexperienced programmers. People in the industry today will tell you that the days are gone when individual programmers created everything on their own. The Atari is one of the few machines where this is practically essential. Until now, that is!

If you don't fancy creating your own graphics for your games, then let us know and we will provide you with some top quality graphic screens for a small fee.

c) Sound and Music - Creating sound on the Atari via its powerful Pokey sound chip is not difficult. On the other hand, it's not everyone who has the patience and musical knowledge to create really good chip music.

If you haven't a clue where to start, then you can leave it to us - again for a minimal fee.

d) Play testing - Once a program is finished, it's time to give it a thorough testing in case any serious bugs might be lurking. It's very difficult for lone programmers to test their oen software effectively since they know how to operate the program properly, and are unlikely to do anything unexpected.

If you have a completed program that requires testing, send it in to us and we will produce a bug report after a week or so of thorough examination, completely free of charge!

e) Publication - Think your program has what it takes to succeed? Why not send it in to us for evaluation and possible publication? We will look at your software objectively and if we think that it can be published, we will give you a probable price band and offer you a percentage royalty based on the RRP of the product. It will then be up to you to decide whether to accept it or not.

We have a number of other services including a programmer's helpline and a bi-monthly newsletter packed with tips on how to get the most out of your Atari. So what are you waiting for? Get out your favourite language and join us today!

>Atari thinking of?
Yes, I remember seeing that. 1450XLD must have been in the planing stages when the manual was produced. Wasn't DOS 3 designed especialy for use with the 1450XLD?
Aw! it wasn't that bad, it was just different. My first DOS was DOS 3, and I used to quite enjoy it, I used it for quite a long time. When I first used DOS 2.5 I thought THAT was horrible, but I got used to it in the end. Now I mostly use Mydos (for the time being....).

The main problem with DOS 3 was having to switch disks if you only had one drive. However I reckon DOS 3 would have worked quite nicely with a decent sized ramdisk (except it didn't have a ramdisk handler of course :-)).
Maybe it was just ahead of its time....

>
>--PC

I would gather then, that the TCP/IP interface to the 8-bit has been
completed. (I think not). If you were going to run x-windows over
a serial cable (even at 19200) it would be a joke!!

I love my 8-bit, but geez, lets get real on it's capabilities.
I don't think I would feel comfortable with it as the main computer
controlling the space shuttle. There are just SOME things it is
not going to be able to do without a zillion dollars in modifications.
There is an IDEA. Mabie we can make a expansion card adapter out of
the atari motherboard and install it in a pentium pc. Someone should
be able to do that over their christmas holiday.

4475. Emulation/6502

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-09 18:36:30 UTC
From: feb6399@ultb.isc.rit.edu
Message-ID: <1993Dec9.183630.14884@ultb.isc.rit.edu>
Source record: 104190

Could anyone out there mail me a list of the quirks of the 6502
for the Atari? (bugs, etc...)
I know all of the basic 6502 ops, but not the effect of
undocumented opcodes, or bizarre side effects of normal
instructions under extreme circumstances (except the JMP(indirect)
bug with page-wraparound)

Also, I need details on how to affect all the flags
for the decimal mode versions of instructions (just ADC and SBC,
right?)

All help would be greatly appreciated... I need
this to finish up my X-Windows Atari Emulator so I can finally upload it.
(and then I'll probably write a standalone PC version)

-Frank

It might be cuz it's one of those PAL Euro. demos or something (I haven't seen it yet). My copy of the Halle Demo usually dies after a few demos (the same number each time. :) It's not random! hehe!)
Dunno.. Do you have BASIC disabled/etc. if you need to?

I may get flamed for suggesting this, but you might consider getting a used Tandy 100 or 102 instead. Or connect a small TV to the Atari (I think there are spacesaver TVs that fit under a kitchen cabinet).

Wait! Don't you mean 'ATA' on one, 'ATD' on the other?

If you get a 'NO DIALTONE', just type 'ATX0' to ignore those types of
errors.
My friend and I (he has some fancy IBM and I have a 1200xl) connect while
we're talking on the phone. One of us types 'ATA', the other 'ATD' and we
both hang up the phone handsets.

One problem tho seems to be that we always have to do it the same way (I
forget which, but, ie, if I type 'ATA' and it works, then I KNOW that me
typing 'ATD' won't.. I think it's a bug with the SX212??????)

4488. Pokey chip in 7800 Ballblazer cartridge

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-09 21:58:07 UTC
From: ifarqhar@laurel.ocs.mq.edu.au
Message-ID: <2e871f$3fi@sunb.ocs.mq.edu.au>
Source record: 103976

I yesterday purchased the Ballblazer cartridge for my 7800, and having heard that it contained its own sound chip (thinking that it would probably be one of those early TI 4-voice things), I had a peek inside. What I found was a 40 pin chip, which according to the silkscreen, is called "Pokey". Although I have never owned an Atari HCS system (I desperately wanted to, but when they were around I never had the money), I have a vague recollection that Pokey was one of the custom chips Miner designed. As the quality of the graphics and sound are better than anything else I have seen on the 7800, it doesn't seem unreasonable to assume that they've moved the graphics and sound controller onto the cart, using one of the old HCS chips.

I've checked around the network yesterday evening, but cannot seem to find any programmer's documentation for the 8-bit Atari systems anywhere. I'm curious as to what is in this chip, so if anyone could give me pointers, I'd appreciate it!

Ian.

4489. Re: Snapper v0.2 FTP Software DatabasE

Hi!

I thought that all you people out there had just given up on the idea, so I let it ride for a while, and I recieved the princely amount of one (1) reply!!

Well, let's start with the BASICS (not the language ;^)).

A few of us decided that it was a pain in the butt trying to find X software package, with X.XX revision, etc. There are many FTP sites out there, and it takes ages to search through them all, even with an archie search. So what was proposed is that we create a database, similar to the FISH (File Index S... H...) things that the LINUX group has. Basically what the DataBase will have is a list of all the Atari programs / files / related stuff, where it can be had, what it's latest revision is, etc. What you as net users are asked to do it to fill in entries, send them to me, and I will enter tham into the DataBase.
Now, at the moment I am doing the Snapper on Atari Works, mainly because I don't have any better DataBases at the moment (DataManager is a dog ;*)), and also it has the ability to export comma-delimited files, so anyone can use the DataBase, even as a text file.

Well, I hope that answers a few questions, I will post another revision on Monday, I hope that all you avid Atari supporters will support this too, as I feel alone in the void ......

E-Mail me if you have ANY Questions ....

Best Regards,

Karl Meyland.

[...]

I see that my post was confusing. I wasn't talking about running X on an Atari, but running an Atari in a window on X. No Atari hardware, only a program that runs as a Unix process pretending to be an 8-bit Atari.

As to controlling the space shuttle, considering the number of computer problems they've had, it might be more reliable. (Though that was mainly in the first few years and was probably software, not hardware.) Actually, the shuttle is rather old technology, including the computers. With all the work that went into the software, they won't upgrade them unless they start having serious problems.

The 1450xl and 1450xld (with drive) were dropped by Atari due to the release of the ST line and the more profitable 130xe series.

Atari didnt think those machines would make any money "at the time".

Only a few select people own one of those machine. Atari Corps. Bob Brodie is one of the lucky few - as he found it scrapped and ready for the garbage bins at one of Atari's warehouses!

How would it be!?!

Now, now Jim..

The 8bit is still fairly powerful, even by todays standards.

I have a SUN SPARC, SCO UNIX (486) server, a Compaq 486dx II 66 and
an array of other powerful machines at my disposal daily, and yet I
still come home and would rather turn on my 130xe than my 486!

Anything is possible, you just have to make it happen!

: would be interested in this have access to a good C++ compiler?
: With C++ I can write code that is at least as efficient,

Yieeee... what's this about C++? I never really paid attention to C++ since
it seems so non-standard. Is C or ANSI C that much slower? I know C (ANSI)
is EXTREMELY portable, but Turbo C is just HIDEOUS if you want to move it about.
I had always thought C++ was the same way... would a C++ compiler on a Sparc
even recognize most of the C++ you generate on... I assume it's a PC, right?

If C++ is fairly portable, and is definitely faster, sounds great! If not,
well, you're the one writing the code and know best what would speed up the
emulation - by all means, do what you will, and GOOD LUCK!

(I NEED to see this when complete!)

There is an 8-bitter in Needham, MA who runs his Carina BBS on a
1450XLD. I haven't seen the machine myself, but I hope to sometime soon.
If interested, the BBS# is (617)444-4310, SysOp Krishna. NOTE: the BBS is
a little flaky, crashes frequently (possibly due to software incongruities?)
I am basically his only regular caller, and I'm sure he would welcome
more 8-bitters.

: '86...

Nah, if I recall, some guy was working on one for the Atari 8b... hmm, now
that you mention it... I'm starting to wonder... was it ST??? @($@*%$!#$%#&*&^$
it's been years...

: Compare Karateka on the Apple II to the Atari 8-bit version. You will
: be surprised to find that the graphics on the Apple version are
: slightly better (more color, in fact!). I suspect that the Atari version

Not surprises... Karateka on the 8-bit Atari was so-so... a few of the
software companies of the time DID make direct ports of Apple and a few
Commodore versions to the Atari.

: is a port of the C64 version- graphics and all. To get in the extra colors
: in GR. 7 1/2 they would've had to use player-missiles or/and DLIs, which
: would've taken more work and more skill.

Yep... Thought I'd include this section before continuing my babbling.
At least one company wisened up a bit and released a revamped Silent Service
for the Atari that took advantage of quicker routines and ENHANCED GRAPHICS
on the Atari systems. The original was a C64 port if I recall.

>Also, I need details on how to affect all the flags
>for the decimal mode versions of instructions (just ADC and SBC,
>right?)

Also CMP.

None of my books described flag behavior in BCD mode, but they all said flags did not work correctly. They're right, as I did a few tests in the debugger. Note that these tests were not exhaustive, and may not be sufficient for what you need.

Flags after an ADD:

The N flag appears to be set when the MSB is on, as in the numbers $80-$99, but only if there was no carry from the operation. I added $90 and $90, came up with $80, and the N flag was clear, C and V were set.

V appears to be set only when both numbers added were $80 or greater, regardless of whether the result is $80 or not. Both $80+$90=$70, and $90+$90=$80 had the V flag set.

The Z flag is strange. It is not set when the result of the ADD = 0, and was not set for most of the tests I did. However, adding $90 to $70, produced $60 with the Z flag set!

The C flag is the only one that seemed to work as expected, and would of course be neccesary for doing mulit-byte BCD.

After SBC or CMP:

Z flag appeared to work correctly here, as did C.

N was set when subtracting a negative number from a postive number. Like $60-$90=$70 with N and V set.

$80-$90=$80, with N set and V clear. $90-$10=$80 with N set and V clear. $80-$10=$70 with n clear and V set. $10-$20=$90 with N set and V clear.

Hope this helps.

>drive. However I reckon DOS 3 would have worked quite nicely with a decent
>sized ramdisk (except it didn't have a ramdisk handler of course :-)).
>Maybe it was just ahead of its time....

Alright, maybe I was a bit harsh on it. But I still think they made it
user-friendly at the expense of usability, most people at that time only had
one disk-drive (if at all), and worst of all, it was entirely incompatable
with DOS 2. Which DOS did all the existing applications use? Yup, you guessed.
If they'd based it on DOS 2 like they did with DOS 2.5, people wouldn't
have been stuck with disks full of DOS 3 files. I can't even see what
advantages the DOS 3 format had over DOS 2 (except it was Enhanced not single
density- but DOS 2.5 proved they could easily convert DOS 2 to do this...)
Possibly it could've been a success on an expanded system, but on the basic
1050/800XL combination, the frustration it caused soon outweighed its
advantages....

>

People are producing software for it. Me for a start... and I know of several others, look around you... DGS, Tiger Developments, the new 8-bit Gold, Derek Fern... all these just in the UK. Do you realy want to know why more software isn't being produced? it is not due to the lack of programmers, or due to people not willing to produce software... the reason is that NOBODY ACTUALY BUYS IT!!!!!! That is the main reason why all the old companies dropped the 8-bit... they didn't do it 'cos they wanted to, they did it 'cos they couldn't sell enough copies of games. I mean they are businesses after all.. and they are not going to produce games for a machine if they can't make any money out of it.
That's why Zeppelin stopped producing games.. they didn't sell enough to cover the costs.. that's why Atlantis stopped, and Harlequin, the list goes on... and these are just in the UK, I bet our friends in the USA and other countries could tell similar stories... I you can quite easily spend 3 to 6 months (or much more) developing a decent comercial program, you finish it, put it on the market, and it sells 20 to 40 copies..... yeah that was REALY worth it. I've seen this happen. I've been involved with Tiger Developments for some time now... and the games just don't sell too well. Even after good reviews in New Atari User. I mean Neil Ottaway's main goal when releasing a new game is to cover the costs of advertising in NAU. Once that has happened anything else is extra. That's how many copies sell, that's how much money he makes... So why don't people buy the games? <shrug>

Some people just can't be bothered, others think: "hmm that's a nice game...
I know I'll get a pirate copy of it...". I have seen people do this.
Ask Dean Garraghty at DGS what things are like for him, I reckon you will get
a similar story. Even "giants" like Page 6 and Micro Discount complain about
lack of sales... and how about Miles Better Software? what's happened to them
I haven't seen any big adds from them like they used to run in NAU.....

Software houses don't just ignore the 8-bit because they feel like it, or
because they think it is an inferior machine.. they do it because games DO
NOT SELL AS WELL AS THEY DO ON OTHER MACHINES. A sad fact but true.

I don't want to dampen your spirits, just pointing out the reality of the
situacion... I wish you the best of luck... just don't expect too much and
you won't be disapointed.

The real problem is not in producing the software but in getting people to
buy it. I don't know what it is like in other countries, but people in the
UK just don't buy software. If you can contradict me in this then please do,
I would LOVE to be proven wrong on this account, but it doesn't look likely.

Well while I'm at it I might as well say that if there is anybody reading this
who might be interested in selling copies of Tiger Development games and
utilities abroad then please e-mail me, and I can put you in touch with Neil.

>Software houses don't just ignore the 8-bit because they feel like it, or
>because they think it is an inferior machine.. they do it because games DO
>NOT SELL AS WELL AS THEY DO ON OTHER MACHINES. A sad fact but true.

It's not just the 8-bit Atari that has suffered in this way. The 8 bit market as a whole has seriously dropped in the last couple of years. The Spectrum arguably has suffered a worse decline in the UK- it used to have good support in this country at least, but most software coming out now is just re-releases of old games, and stuff on magazine covers. The Atari *NEVER* had as much support, yet it seems to be hanging on.. for the size of the market, it is doing remarkably well.

Zeppelin dropped the 8-bit Atari a while back, its true, but I read of them dropping Spectrum and Amstrad support only a few weeks later. The Atari has always had more enthusiastic support- many Ataris are still in use. You can bet that the Spectrums which have been discarded in favour of Super NESs, Mega Drives etc. are now gathering dust in a cupboard somewhere. This is only the British market, but you can bet that similar things are happening in many other countries...

The moral is, if everyone sticks together, and doesn't take support for granted (haven't we all been guilty of this at some point?) then we may yet have the last laugh at the owners of all those more "popular" machines (Ha ha ha..ahem).

I remember building a few projects using the joystick ports of my 800XL. Couple of guys at Penn built a fully functioning manual scanning densitometer to quantify autoradiographs for their research on receptor-binding drug pharmacology. Someplace buried in my warehouse, I have some Antics which show the I/O's and addresses...I don't know where to look right now. I also built a little infrared detector system which piped into the analog inputs of the joystick which was measureable (0-256 scale) in Atari basic. AAHHH the good old days! If Atari had only had some decent documentation for it's hardware and software, I wouldn't be typing this on my AT clone-80286. IBM machines simply don't have the flexible analog and digital I/O's of the 800xl, otherwise I'd still be playing joystick interfacer.

Source record: 103974

This may be an obvious question to some people... but, how dangerous is it connecting things directly to the joystick port? I was doing some stuff with heat sensitive resistors a few years ago, and whilst connecting something I got a funny character on the screen for no reason at all (I WASN'T using any Pokes either..) I think that somehow, one of the bits in the screen memory must have got altered, perhaps it could've been worse (I wasn't going to try it again though!)
Has this happened to anyone else?

Hmm, well, it IS an atari 8-bit computer, albeit an IBM XT clone. An odd topic to add to a WIDE variety of odd topics here! Sure, sounds great to me! I'd love to get a hold of one of those now-a-days anyhow - for the size and features, it was GREAT! What type of problems, quirks, special features, etc. have you found? Any IR transfer protocal addons for the unit? Is it still supported in your area (can you get the RAMcards and other hardware)?

If you had your choice, which printer would you rather use . . .

An Atari 1027 Daisy Wheel or

A Seishoka direct connect??

I just picked up a couple of these and am going to be mailing them off
to my family in Washington State - as newbie computer users. Which printer
would be the best and easiest for an entry level computer owner?

4523. MUX based System

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-12 07:56:25 UTC
From: KAMARO_KID@delphi.com
Message-ID: <931212.10585.KAMARO_KID@delphi.com>
Source record: 103984

Anyone interested in purchasing an entire MUX based system off of me . . .
or better yet, how about trading something for it?

The "system" consists of:

CSS MUX, 2 slave carts, 1 master, 2 ROMS, software and manual
One 320k 130xe with MUX ROM
One 256k 800xl as MASTER

You simply provide the peripherals and the second slave CPU as I'm keeping
my 1meg beefed up Newell machine!

Cash price for above "system" would be somewhere around $350.00 or so..

Trades are seriously considered!

4524. MIO Repair

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-12 07:57:59 UTC
From: KAMARO_KID@delphi.com
Message-ID: <931212.10679.KAMARO_KID@delphi.com>
Source record: 103985

Is there anyone out there that still performs repair work on MIO's?

My MIO printer port is shot and I'm starting to loose data at 9600 baud
on the modem port.

To make things even more difficult, when using my MIO - I cant use my R-time8
cart.. the two just dont want to get along. Very odd!

The Rtime8 works without the MIO perfectly though.

4526. atari 8-bit items for sale

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-12 21:50:24 UTC
From: cohen@GOMEZ.phys.virginia.edu
Message-ID: <00976E97.73801540@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 103988

The following "stuff" (hardware, software, books) will be sold to best
(reasonable) offer. Please pick up any items you are interested in,
there is NO need to buy everything! I am looking for ofers on the available
items.
Please e-mail offers to COHEN@BORN.PHYS.VIRGINIA.EDU , or call (804)293-8973
late evenings in case you have no e-mail account (prefer e-mail, please).
I will respond to every e-mail message I get here (if you get no response,
please try again).

Thanks!

***** HARDWARE *****

Except where otherwise notes explicitely, all hardware was in working condition
when used last (I no longer have the Atari computer to test it now).
When problems are known to exist, details are given.

Computer- Atari 600XL, with power supply and video cable; no manuals.
Works fine!

Printer- Star-Micronics SG-10
(Centronics parallel standard interface, for use with Atari
850 unit and parallel cable sold below or equivalent). Asking $60.
Monitor-
1. Monochrome monitor, composite video, no sound, excellent for
80-column work, text-intensive applications and BBS. Picture on
this monitor is MUCH sharper than any color monitor will provide.

2. Color monitor- BMC 13" with composite color video and audio
inputs. Asking $85.

Atari CX853 16K RAM memory module for Atari 800
Axlon RAM CRAM 32K memory module for Atari 800
Modem cable (to any RS232 modem) for Atari 850 unit
Parallel (centronics) printer cable for Atari 850 unit
Atari 1027 Letter Quality printer almost new, in original box, with manual,
but does not work properly
Atari 1020 color printer/ plotter with manual.
Another Atari 1020 Color Printer/plotter with manual, this one need work
on print spool

Atari REMOTE-CONTROL joysticks system (originally sold for the 2600 VCS),
with base unit, and a pair of remote joysticks).

Atari paddles
Joysticks- various types and shapes, all tested and working well.
Atari 1030 Modem with manual

Taihaho Direct Connect 300/450 baud modem model TH-003 autodial/auto answer
(I think this connects to the joystick port)
Atari 410 Program Recorder (the original one).

Hardware items sold as-is:

Atari 1010 Program Recorder - belt of mechanism inside came off.
Atari 1010 Program Recorder - save: ok, load: no.
If interested, please make (a low...) offer on both. Main units only,
without cables

Atari 400 computer- sold as-is, gives no picture on the TV screen.

***** SOFTWARE *****

Cartridges-
==========
BASIC (CXL4002) with manual.
BASIC (CXL4002) with manual, and original box.

Disks- (All are original disks)
======
TimeWise with manual and original box
Sargon II with manual and orginal box
Music Construction set with original binder and manual
Pinball Construction set with original binder and manual
Atari Translator
Atari program Exchange (APX) ATSPEL/AT.WRIT.-program 1.0, by R.S. Kistler
Atari program Exchange (APX) ATSPEL/AT.WRIT.-dictionary 1.0, by R.S. Kistler
Atari DOS 2.5 with manual

plus about 50 generic disks with shareware, and many types of programs
(word processors, terminal emulators, utilities of all sorts, games, etc.)

Cassettes-
==========

Joystick Sketchpad with manual (new, sealed)
apx Eastern Front 1941 (with manual and original box)
Thorn EMI Compute 4 and Reversi (in original box with instructions)
Atari Statistics I (with manual and original box)
Atari States and Capitals (CX4112)
Atari Hangman (CX4108)

Books-
======

Bill Carris- Inside Atari BASIC
ICD SpartaDOS Construction Set
Your Atari Computer
Computers for Kids- Atari edition
Albrecht, Finkel and Brown- Atari BASIC- XL Edition
COMPUTE!/Richard Mansfield- Machine Language for Beginners
Atari BASIC Reference Card for Experienced Programmers (Atari, 1983)

An Introduction to the Atari DOS 3 (Atari, 1983)

Please e-mail offers to COHEN@BORN.PHYS.VIRGINIA.EDU , or call (804)293-8973
late evenings in case you have no e-mail account (prefer e-mail, please).

In the reference I usually use ("Programming the 6502" by Rodnay Zaks),
there is little detail about subtleties of decimal mode. I suggest you
get a debugging monitor (e.g. a right slot cartridge for the 800) and
single-step through all the instructions, checking status bits carefully.
I suspect your problems come from some different behavior of how the
status bits are set in decimal mode.

>connecting things directly to the joystick port?
Well, it could fry your pokey chip, maybe even more. Is that dangerous
enough? Be very careful what you plug into a joystick port, unless you
really know what you are doing. There can be 5 volts at substantial
milliamperage running around there. It won't hurt you, but it can zap chips.

I used to have a Seikosha. It was easy to use and tolerably reliable,
but noisy and the print was ugly. I think a daisy-wheel might be
better for those who use it for writing letters or something like that.

>I suspect your problems come from some different behavior of how the
>status bits are set in decimal mode.
>

According to my book, Levanthal's, the decimal mode bit only effects the ADC and SBC instrustions (still minimal information on the differeences). Flags effected by these two instructions are the S flag, the V flag, the Z flag, and the C flag. A note is made that the zero (Z) flag is not valid in decimal mode.

So we have the sign (S) bit .. the value of bit 7

the overflow (O) status bit ..

the zero (Z) status bit .. 1 for zero, 0 for non zero .. note the invalid comment above

the carry (C) status bit .. carry out of bit 7

OK .. further on in the book, a page on decimal mode limitations.

:When decimal mode is set .. all arithmetic is carryed out in decimal
:mode .. ie if the lower 4 bits end up greater than or equal to 10
:(0a) approriate addition is made to keep the BCD result correct.
:This includes subtraction as well as addition, regardless of addressing
:mode. However .. the increment and decrement instructions produce
:binary results even though the decimal flag is set. Thus DEC, DEY, INC,
:INX, INY can only be used to maintain binary counters.
:
:Subtractions in the decimal mode produce correct BCD results with the
:Carry being an inverted borrow. For example, if the Accumulator
:contains 03, the addressed memory location contains 27, and the

:Carry contains 1, after the execution of an SBC instruction the
:Accumulator will contain 76, and the carry will be 0. As in binary mode,
:a Carry of zero means that a borrow has been generated.
:
:The Sign bit is not meaningful after additions and subtractions when
:the decimal mode flag is set. It reflects the result of the binary
:operation, not of the decimal operation. In the (situation mentioned
:last paragraph) the Sign bit will be set (as it would be if the numbers
:were binary) even though the decimal result (76) has a most significant
:bit of zero.

Hope some of that helps ... still kinda skethcy .. I was hoping to
find hints in my 6800 stuff, but their decimal stuff is much more
rudimentary, and different.

A few years ago a friend of mine built a midi adaptor that he saw in Antic.
The adaptor was hooked up to the joystick port. Anyway, he mixed up the pins
that the adaptor was supposed to be hooked up to and his power supply burned
out, fried.
Hope this helps.

From: timuszyn@jupiter.cse.utoledo.edu
Message-ID: <CHyMFx.BxE@utnetw.utoledo.edu>
Source record: 104000

Sorry about that last post... after posting it, it just wasn't right... can't delete the darn thing either, yet. We have this silly 1 day wait queue for incoming and outgoing news articles. I can't even see exactly what I said myself right now! Heck, this guy's probably making his living off these posts (buying whole systems and selling off individual components/software to make a profit). Ugh. eeep...

I just want people to be informed that the old Atari 8-bit is still BARELY supported! If and when you want to purchase something for it, check with some of the existing distributors of NEW/unopened merchandise, especially since much it costs less than what scalpers are asking for it used!

4537. Re: Yes-- there will be an Atari emulator

>:The Sign bit is not meaningful after additions and subtractions when
>:the decimal mode flag is set. It reflects the result of the binary
>:operation, not of the decimal operation.

This finally makes sense. The Z, N, and V flags are computed based on the
binary result of an ADC or SBC. Only the C flag is correctly computed in
decimal mode.

This demo comes from Hungary, those guys apparently use a PAL system, because
it works fine on my PAL 130XE. No problems at all.

It's a great demo, some parts are maybe even better then in the "Halle Project".

From: ultron@csd4.csd.uwm.edu
Message-ID: <2eif3mINNgrn@uwm.edu>
Source record: 104002

If you've been following the roll-out of the Atari Jaguar (and if you haven't shame on you) you've probably heard about the RF cable/switchbox problem. Apparently Atari sent some inferior switchboxes that cause mucho interference on TVs. Atari is sending out new switchboxes to fix the problem. Followup posts to this problem have stated that Atari switchboxes have always sucked (back to the 2600 and 800 days) and newer cables/boxes remove squiggly lines and noise that the old boxes had. The new boxes are also supposed to strengthen the signal.

I have only used the switchbox that came with my Atari computers for the last 10 years. Am I totally non-hip and out with the times? Should I be using some new-fangled switch box to connect my dear old Atari? Will I see vast picture improvement over my old switchbox?

Sheesh, I go and play in the ST and IBM world for a few years and look what happens!

Source record: 103856

KAMARO_KID@delphi.com wrote:
: Is there anyone out there that still performs repair work on MIO's?

Have you tried contacting ICD? They are still in business.
I'll make a couple suggestions for you tho'...

#1 - check out the power supply. A one meg MIO draws around an amp of current, and a 256K MIO only a bit less. The MIO power supply is in two parts. First is the external brick. Try using a car, or 12volt motorcycle battery in its place. Ifit won't turn on at all, you have the polarity backwards. If everything works, you have found the problem.

Second is the internal part of the power supply. The MIO could use either an AC or DC input, and ICD supplied whichever was less expensive at the time. The MIO has an internal bridge rectifier and voltage regulator. The earlier MIOs also had filtering capacitors which had a tendency to go bad. If yours has a couple largish capacitors right near the power input, replace them first.

#2 - if the power is fine, then most of the chips are socketed and realativly inexpensive to replace; you can replace all the chips cheaper than one service call by ICD.

Hope this turns out to be of some benefit.

I wouldn't think you'd have to "get into the guts of GTIA," etc., to hook up an LCD display to the Atari 8bit. You ought to be able to do it through the joystick ports, with a little bit of appropriate signal-conversion circuitry (probably on a board with the LCD and any driver hardware it requires) and some custom device-driver software on the Atari. I could definitely do the driver if somebody else would build the board...

Anyhow, for those not completely reading the original msg,
here it is in short: Atari supplies new RF switchboxes to fix
distorting video on television displays. This may be able to
eliminate some of the diagonal line interference of the old
Atari's as well?!? If so, I'd like to hear some feedback of
users who have tried using the new box with their 8-bits!
I frequently have to reach in the back of the tv to pull or
push on that stupid little connector box to get a better
picture on screen! Anything would be better!!! How much are
the new boxes, and most of all, ARE THEY WORTH THE EFFORT?!?

From: lelie@smail.srl.ford.com
Message-ID: <lelie.6.0009FE0A@smail.srl.ford.com>
Source record: 103863

I am parting with some older Atari stuff. If interested in any part please make offer.

1.) A VERY early Atari 800, SN 060-0114 (that SN is hand written on the bottom, a Atari service man told me that is literaly #114!) Please note, the very early 800's used silver contacts on the memory boards instead of gold, the edge contacts corrode easily and must be cleaned frequently. This was originally a 8K (!) machine but was expanded to 48 k with more of those silver contact boards. Also, this is a CITA (not GITA) graphics machine. No power supply, and the keyboard doesn't work well. In other words, this is a collecters item, NOT an everyday workhorse. It works today, but??

2.) Monkeywrench (right side!) cartridge for above w/manuel. Only right side cart I ever saw. This is a set of tools for programmers.

3.) MAC 65 assembler/debugger cart for Atari w/manuels. Excellent assembler/debugger.

4.) Assortment of Softside magazines. About 20+, 1980/81/82. This was a magizine for Atari, TRS-80 and Apple II C with aprox. 3 games each, plus tips for programmers.

Make offer on any of above to my E-mail, my wife says I have to part with it, so they will have to be trashed is no one is interested.

From: trimblte@rosevc.rose-hulman.edu
Message-ID: <2ekf04$hl4@master.cs.rose-hulman.edu>
Source record: 103862

Reading about the MIOS problem suggestions makes me remember
that somwhere at home, there's this old 800 power supply that died.

I think it was somehow shorted out across the leads. My question is:
Are the power supplies fused? (I assume) How do I get into that funny thing to
replace said fuse?

Thanks....

Todd Trimble

4555. More Gauntlet and the Digest!

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-14 14:32:57 UTC
From: RG9@VAX.YORK.AC.UK
Message-ID: <9312141432.AA15226@cs.utexas.edu>
Source record: 103866

I am posting this message again since it hasn't prompted one reply yet!
Maybe it didn't get through first time or just maybe nobody knows anything
about Gauntlet!

I would appreciate help from somebody, anybody????

I have recently come across a problem with the game Gauntlet, the commercial
version released by Mindscape in the US and US GOLD in the UK.

Heres the story, I own the original US GOLD (UK version) of the origianl game
master disk, however I recently bought the Deeper Dungeons extension disk.
This Deeper Dungeons however is the Mindscape version and guess what, the
two are incompatible!!!!! US GOLD also did the Deeper Dungeons disk and
I've no doubt the code is very nearly the same but Mindscape added some extra
protection and now the two are incompatible.

So be warned if you buy Gauntlet and the Deeper Dungeons make sure you are
getting compatible versions, ie both by Mindscape or both by US GOLD.

Now I would like to plead for help, as anybody got the original Mindscape
master disk for sale at a very reasonable price, or maybe even the US GOLD
version of the Deeper Dungeons?

If anybody can help please e-mail me (Richard Gore) at;

RG9@UK.AC.YORK.TOWER or RG9@UK.AC.YORK.VAX

NB from the USA you have to invert the uk.ac.york.vax bit to
vax.york.ac.uk and same for the tower address (well I'm told you
have to do this!!).

PS What has happened to the Digest? Why do I only receive digest reports
from info-atari8 every three or so weeks? They used to arrive almost every
other day? Has nobody posted anything? Has the cross posting system died?

This is what I wanted to point out too. The Digest seem to arrive very
unregularely. It can't be the amount of posting since c.s.a.8. is frequented
rather well. I guess the cross posting system doesn't get regular newsfeeds
this days...

Well, if you would have read my post more closely, you would have understood that I was asking if the new generation of A/V switchboxes that are used with Nintendo/Sega/Jaguar are compatible with Atari 8-bit computers, and if they provide a better picture than the R/F switchboxes that came with the computers. Whoa, that's one big sentence!

So do they?

About the switchboxes in the Jag....
It was speculated that Atari was being really cheap
and unloading their surplus switchboxes from the
8-bit with the Jag. Bob Brodie recently said that
this is NOT the case. The switchboxes that Atari
bought for the Jag were cheezy (the appropriate
technical word :)) and that is why they did not
work well. In fact, Bob said that if Atari was being
as cheap as people thought they were being (by dumping
old switchboxes) then they WOULD have worked. Don't
know if this clears anything up, but I thought it
was an interesting story (sorry to get off the topic).

Quoting RG9

R >PS What has happened to the Digest? Why do I only receive digest reports
R >from info-atari8 every three or so weeks? They used to arrive almost every
R >other day? Has nobody posted anything? Has the cross posting system died?

This is what I'd like to know, the last issue I got was 270... I've been
re-sending 'em to about 20 non connected people and it would really be nice
to either see the problem fixed or have someone at least let us know that
the digest has ended production....

Mike

Umm. I dont use a TV for video - so dont have the problems you mention.

Get a Commodore 1702 and all your video problems disappear! [grin]

4567. Re: Atari 800 Fu@kin Awesome!

Newsgroup: comp.sys.atari.8bit

Another cool thing about the 800: It's totally shielded! I'd like to use
one as a fuel injection controller eventually, and this feature will
be beneficial to the project.

4568. Re: LCD Display

Chris_F_Chiesa@cup.portal.com wrote:
: I wouldn't think you'd have to "get into the guts of GTIA," etc., to hook
: up an LCD display to the Atari 8bit. You ought to be able to do it through
: the joystick ports, with a little bit of appropriate signal-conversion cir-
: cuitry (probably on a board with the LCD and any driver hardware it requires)
: and some custom device-driver software on the Atari. I could definitely do
: the driver if somebody else would build the board...

: Chris Chiesa
: Chris_F_Chiesa@cup.portal.com

Well, exactly what would be needed of this board? If you could do the
driver, I could possibly do the board.

Just a simple LCD display driver? Or something a little more complex?

When writing to request catalogs,
it's always a good idea to include
a Self-Addressed Stamped Envelope.

When writing to foreign firms, try enclosing
a couple of International Reply Coupons (IRC's).

4571. Hardware specs & vendors

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-15 23:05:22 UTC
From: ATWARECK@ELECTRICAL.watstar.uwaterloo.ca
Message-ID: <ATWARECK.3.2D0F9831@ELECTRICAL.watstar.uwaterloo.ca>
Source record: 103879

Hi,

Just a few quick questions for the technically oriented:

I am interested in obtaining some hardware specs on the 8-bit, specifically
schematics and custom chip pinout/specs, including the ANTIC and 6502.
I recently came to the conclusion that the 6502 is NOT pin-out compatible
with the Rockwell 6502, and so would like to get some specs on it.

On a similar note, where could I purchase some 65816 cpu's?

If at all possible, I would like to obtain at least a telephone contact for
both the specs and the 65816.

Thanks in advance,

Source record: 103881

I would be semi-interested in coding a program for my PC that can access my Atari 1050 via the serial port for a holiday project. I don't need any help on the PC side, I have a thorough understanding of serial port control. But I know very little about the Atari standards, beyond the fact they are, indeed, serial.

So, what sort of protocols does the Atari disk drive use to communicate with the system? Specifically, what's the baud rate? How are the commands organized? What is the voltage level? What is the pin-out? Any information or pointers to information are greatly appreciated!

Thanks! -Nate

Hmmm... Now where did I leave that .sig, anyway?

This is an understatement, the damned thing has shielding that's about
1/8" thick. It's built like a tank, or an American car from the 50's.

4578. Re: Switchboxes

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-16 11:20:33 UTC
From: rje@cs.nott.ac.uk
Message-ID: <1993Dec16.112033.1064@cs.nott.ac.uk>
Source record: 103889

>that I was asking if the new generation of A/V switchboxes that are used with
>Nintendo/Sega/Jaguar are compatible with Atari 8-bit computers, and if they
from what I've heard in the rec.games.video.classic group the new boxes don't
like any of the old machines...2600, 5200, 7800 etc. presumably that would
include the 400-800-XL-XE range too (taking into account that the 5200 virtualy
IS a 400). Apparently they don't have the little lever which allows you to
switch between the computer and tv. The switching is done automaticaly when
the box sees an output from the games machine. However the boxes don't
recognise any of the output from the old machines....so it would look like the
answer to your question is no. However if you want to get away from
switchboxes you should take a trip to this side of the Atlantic...PAL systems
don't use switchboxes!!! Just plug the computer and TV aerial (antenna)
into a coax splitter, and then into the back of the TV, no switching required.
grin
OK now I've got a question: what does the switchbox actualy do?
I once tried connecting the output from my (NTSC) Atari straight into the
75 Ohm connection on the back of my (NTSC) TV (with a couple of wires), and got
a decent picture. Does this mean that the only use for the switchbox is to
connect the Atari to the 300 Ohm connection? Or does it do something else as
well? Does this also mean that you can bypass it by connecting directly to the
75 Ohm? (That's what we do here in the UK).
The cables here come with a 75 Ohm coax connection at one end, so just
plug one end into the Atari and the other into the TV, end of story.
But is this because we have extra circuitry inside the micros here?
Or just because everybody uses coax here for the TV, so you just don't need
the switchbox, unlike on NTSC systems where 300 Ohm used to be quite common?

Today is my last day on the net for 4 weeks (going home for Christmas),
if anyone can answer my question can you please e-mail me a copy as well?
Thanks...and a Merry Christmas to everybody :-)

Source record: 103885

Thanks for the replies to my question about dangerous connections to the joystick port.... Sounds a bit risky to me. Next time I do anything i'll be sure to double check the manual!

There've been all these letters about switch boxes causing interference. Is there a way, however, to improve the picture output on the 130XE, ie better colour and no funny vertical lines corresponding to the character positions.. It does this on a colour telly, AND a monchrome monitor. The 800XL doesn't do this. I've tried the adjusting the thing on the bottom of the computer- it only made the picture worse. Is it just the fault of the abysmal modulator in the 130XE, I heard they improved it for the 65XE...

The 130XE in question is a PAL version, do the NTSC versions suffer from this problem?

And while i'm on the subject, has anyone noticed that the "interference filter" or whatever it's called, on the TV lead for the 800XL doesn't seem to make any difference at all?

:love with the system font. (Of course, this isn't
:the only reason that I switched from the Amiga to
:the STe :)).

Ummm... I know this isn't an Amiga or Atari STE group, but apart from the font, what is it you prefer about the STE to the Amiga? I went the other way round.. I used to have an STFM, then I changed to the Amiga.
Did you have an Amiga with Kickstart/Workbench 1.3? I've got Kickstart 2.0, and the font is quite nice, then I got a program called Kick 1.3 which replaces KS 2.0 with KS 1.3... the fonts are different, and so's the appearance of any programs using the default font... the old KS 1.3 font is horrible! So I agree with you. But the 2.0 font is pretty similar to that on the 8-bit Ataris and the ST.. much nicer. Mind you, AMOS still uses the old font... looks *TACKY*.
I always felt the Atari font looked "professional", unlike the default font on the ZX Spectrum and C64 (if I remember correctly....)

I have a few joysticks for sale...cheap...oh well, just repeated the subject message B-)

Anyway, I have :

The Bug,

Cheetah 125+

Quickshot II Turbo

Quickshot I (Yes, These too....but very cheap)

Cheetah Bollistick...for people who like the console type joypad

and also, a Snes joypad called Quickshot Intruder.

These are brand new and have never been used...I think they are shrink wrapped, so why not mail me and get one by Christmas.

Danny.

I think that what they were announcing was an emulator, running on an X platform, that would emulate the Atari 8-bit machine. Not X running on an 8-bit. I agree with your last point - if someone were trying to put X on an Atari, they have more time than sense!

4583. Atari as X10 controller

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-16 13:45:45 UTC
From: cba@atl.hp.com
Message-ID: <2epoq9$6t4@hpuerca.atl.hp.com>
Source record: 103891

Over the past few years, I have slowly propagated X10 devices throughout my house. Normally, the are controlled by timers, but I want more! For quite some time, I have coveted these "home control computers", which both monitor X10 signals, as well as transmitting them. I balked, however, at the megabucks these systems cost.

Instead, I have decided to dust off my old Atari 800XL, and use it as a home control computer. I can't see too many disadvantages; in fact, the only one I know of is recovery after a power failure.

My Atari has 256k, disk drive, and an RS-232 interface. The RS-232 is not what most people think of; it is merely an extension of the daisy chain cable, with a software driver to actually read/write the signals. I don't even remember the name of the company that manufactured it. They are out of business - the last time I tried to call them, I got a Wal-Mart!

Although the Atari lacks a hardware clock, I wrote a clock several years ago that sits in the Critical Interval, so it doesn't suffer from timer slowdown during disk access. It is small enough that it doesn't affect disk acces.

So, I figured that I could put a two-way X10 interface on the serial port, and write a BASIC program to send/receive the signals. Periodically, it would write the state tables out to disk, as a sort of "checkpoint", thus (hopefully) simplifying recovery after a power failure.

Well - there it is; my latest venture into hacking. What do you think? Has anyone else tried this and if so, what have you run into?

4584. Gofer for the 8-bit?

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-16 13:59:13 UTC
From: uj1g@rzstud1.rz.uni-karlsruhe.de
Message-ID: <2eppjh$mjb@nz12.rz.uni-karlsruhe.de>
Source record: 103892

I don't think I'll be lucky, but let's try this:

Do any of you know if Gofer has been ported over to the Atari 8-bit?
Gofer is not to be confused with Gopher, which is something totally
different.

Gofer is a functional programing language, an interpreter actually.
It has been ported to many platforms. The sources for Gofer appear to be
written in C. They can be found on various FTP-servers on the net.
I don't have the time to get into porting of it by myself. I wonder if
anybody has tried this before.

I wouldn't mind seeing Haskell, another functional programming language,
on the 8-bit as well.

Any hints welcome!

Yes, the old 800 power supplies have an internal fuse which will open if the leads are shorted. To get at it you have to destroy the plastic case of the supply. As I recall there is nothing inside the case but the fuse and a transformer.

This happened to us years ago, and I put the transformer, fuse, and a switch into a standard component Al box with captive power cable and the original wire to the 800. A very simple fix which is still working.

Please excuse the ST/Amiga debate but....
I switched from the Amiga to the ST for a few reasons.
First, yes, I am loyal to Atari so that probably figured
into the equation.
Secondly, I was using the Amiga 500 with one disk drive.
Please Insert Volume WB messeges drove me crazy. It was
needed for the simplest things. I love the way that TOS
was entirely in ROM.
Third, I never liked Workbench. I disliked the gaudy
icons frequently used and also the way the Amiga continually
polled the drive.
This is not a slam on Amigas. Now, I realize that these
problems would be addressed with a newer version of WB
and a hard disk. But at the time, I couldn't afford a
hard drive and the current WB version was 1.3. Today
if I were to buy a new computer it might be an Amiga 1200
because the Falcon is too expensive. But, personally, I
think that the STe was a better system than the Amiga 500.

Well, I don't know if X-10 is a standard. All the patents are held by one company, and all the interface ICs are made in one plant.

Basically, X-10 is a method to control devices by sending/sensing signals imposed directly over the power lines. Here in the US, there are quite a few companies that sell these devices. Installation is either by wiring the control device directly into the circuit, or, buying a "plug in" module, plugging it in to the outlet, then plug the device to be controlled in to that module.

Paired up with the controlling modules is one or more transmitters. These can be manually operated, by pressing a button, or it can be automated, such as by timers, computers, etc.

I have never seen X10 for any voltage other than 110, but that may be because there is no need for any other voltage standard here in the US. X10 is an older technology, and it is sensitive to line noise. There are newer controlling technologies out there, such as CEBUS, but that market is still quite small.

I have been amassing quite a few of these controllers over the years, and so I decided that it is time to integrate all these under the umbrella of one master controller. The best way to do this is with a dedicated computer, and since the Atari isn't being used, the task falls to it.

4597. 2600 keypad

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-17 00:09:10 UTC
From: Nick.Bensema@launchpad.unc.edu

I was wondering what kind of output the Atari 2600's keypad generated?
Tell me either in pinout reactions, or the effect it would have on the
Atari 8-bit?

Also, if you have the time, how do I read the second button of a 7800
two-button joystick on the 8-bit? What kind of output does it produce
that makes it different from the left button, but other systems cant tell the
difference?
thanks..

The X-10 interface is a power line carrier rf remote control system designed for controlling lights and applicences. One way control, no feedback (in general, for non-intelligent interfaces). Originally developed by BSR of England (the turntable people .. at least the audio gear is all I know of from them). Details of the control signal I have not readily at hand, but the signal is synchronized to the line frequency, transmitting a burst at the zero crossing. The basic code is a digital one, of something like ten bits.

I have never been too intrigued with directly controlling the X-10 stuff with a computer, hating to tie up a computer for something like that, paritcularly with the power loss recovery problem. But then, that was when I had no disk drive <grin>. Years ago, however, there was an interface designed to use the ultrasonics remote control X-10 controller, and tie that into an Atari joystick port. I did install the required optoisolator in my ultrasonic controller, and fully intended on typing the program in and hooking it to the joystick, but never seemed to be important enough.

An alternative, by the way, is one of the computer controlled timer based controllers for X-10. The computer merely programs the timer settings, or can execute direct commands thru the timer module, but the timer module stands alone with its own battery backup. Several of these, I believe, are on the market. I have a few (I think two) units that were designed to tie to a Radio Shack Color Computer which one of these days I will hack into and figure how to tie them to a standard serial port or some such thing. They seemed to use standard serial ASCII oriented protocols.

Getting to that time of year again, time to hook up the modules for the Christmas lights. My main controller, a simple manually controlled

timer, has been happily trying to turn them off and on since last Christmas, and now it can actually succeed again. Of course, now it is turning the air conditioners on and off every day, with equally little effect. Perhaps my requirements are being met quite adequately already? (<grin> You can see why I have little incentive to computerize the interfaces).

As far as your hardware reasons go for supporting the ST.. fair enough. You have some perfectly valid points, although as I said, the Amiga has improved a bit.

BUT... and this is something that niggles me, every time the old Atari versus the world argument pops up. Why the Atari loyalty?

The only connection that the 8-bit has got with the ST is that they are both sold by the same company. I would even dare to go as far as to say that the Amiga has a closer connection with the 8-bit Atari, because many of the people involved with the 400/800 went on to design the Amiga, Jay Miner for example. Some people have argued that supporting the ST would help support the 8-bits. Rubbish! Atari totally ignored the 8-bit after the ST came out (although I'll admit that if it wasn't for the ST, they wouldn't have survived... probably). Then there was the launch of the "XE Games System", when Sega and Nintendo started making money with their 8-bit systems. Did we get new hardware.. did we heck. The light gun was the only new thing that really came out, and most of the games were rereleases of old ones. When Atari saw that it wasn't working (hardly surprising all considered), they stopped making it in the UK altogether. I know it's still on sale elsewhere, but this doesn't help unless you happen to live where there is the support (I assume it's not on sale in the US anymore either).
In short, if you supported the ST, you were supporting Atari, but this didn't mean they would support the 8-bits. And now the ST is going down the tubes, shortly followed by the Lynx, a handheld game thingy which followed in the footsteps of the 800... it was excellent (I should know, my brother has one of them), but due to Atari's bad marketing, lack of money to hype it, and lack of support (not just from Atari). Then there's the Falcon. But due to the fact Atari is in a precarious position, and it is basically a massively improved ST, it has had trouble getting the support. So what are Atari focusing on now... the Jaguar. From what i've heard, it's great, but how long will they stick with it before they release their next wonder product (and mega faliure).
Don't get the idea I'm criticising Atari, just because I don't like the ST (that's just my personal opinion of the machine anyway). The fact is though I can't see any reason any more for being loyal to Atari.
Since I own an Amiga, I thought you might like to know my opinion of Commodore as well..... Commodore suck! Not quite as badly as Atari perhaps, they haven't been quite as bad in the past year, but I still feel they could support their products a lot better... what happened to the CD-Rom for the A600... oh yeah, we're not making that any more, so there's no point in supporting it... bit like Atari there. So at least this proves it isn't only Atari who are rubbish (this doesn't excuse either company however).
It seems a shame that machines designed by people with vision are held back, or even strangled, just because of the company that happened to buy them (Commodore didn't design the Amiga, they just bought out the company who

did).
Atari almost bought out Amiga.. how many ST owners reading this would
have bought an Amiga if Atari had made it?
Anyway, i'm totally beyond the stage of caring whose name goes on the
box- I generally consider anything on its own merits now.
How loyal have Atari been to Atari users? Support the people who are
supporting your computer, not those you hope will, and you'll probably get
a great deal more back.
Sorry for going on like this, but i'd like to know why anyone should
be loyal to Atari. I used to be, but in the end I realised the only connection
Atari have with the 8-bit anymore is the small metal badge on the box of my
130XE.

I have to add this comment:
Personally, >I< don't think "I know I'll get a pirate copy of it" or "I
can't be bothered with it".. I think "COOL! Too damned bad I don't have
the cash!"
What the main prob. is lately is a big resession. Hell, before I'd go out
and buy any games, I'd get me a new XL system, a Black Box, a faster modem,
a MONITOR CABLE (argh!) (sorry :)), etc. etc... it's thanx to
Shareware/Freeware/PD developers that I have any software at all other than
my own! I'd still be stuck with AW+, DOS 2.5, and BASIC and Action!, but
now I have DDIII, Textpro, BOBTERM! (:)), etc. etc. etc.. sure, a lot of
it is more like "Try it then buy it" but that's what we need lately.. I
never know if Im gonna like a game.. but if I've tried it there's a way
better chance I'd like it. :)

Well.. enough babble (as usual).. let's all buy lottery tickets and go get
some software, eh!? :)

Oh man. This brings back bad memories. I can hear "Anchors away" ringing
in my mind again. Actually, my sister loved the game. When I first got
it, I became obsessed with completing the game. And I did win once!

As for the planet with the ruby chain, I don't remember what planet that
is, or what obstacles you face there. If you could mail a description
of the planet, maybe it'll come back to me. Hey, it's been 5 years since
I played this thing! ;)

As for the objects, once you get all the objects return to your home
world. Go back to that "wierd temple where you can get more energy", and
you will be lifted into a ship. From there, you must search out the
world where more of your kind are (I guess). This is really difficult,
several times I ran out of energy. One time I did make it to a world
where there is a docking bay with a lot of other ships that look like
yours. There is one empty landing pad. Land on that pad, and you've
won the game. wow.

Graeme Fenwick, in an earlier post, questioned Atari Loyalty.

I have not had my hands on an Atari 8bit for years, but I am thinking about buying a whole new 8bit system. I know that Atari will not support it anymore but I like the product. My brother in law has a C64, and I hate that thing.

Load,"$",8 or something like that. Very aggrevating.

The Falcon is rumored to be carrying a game by Id Software called "Doom". I have Doom for the Pc and I know that it is one of the best games going, and that the Falcon will make it incredible.

Atari makes terrific products. They dont last, but they are better then the ones that become so popular.

Steven Baker

I remember him. He had lots of great articles in both _Antic_ and
_A.N.A.L.O.G._ (10 points for the person who can post what that
ancronym really stands for). I remember seeing a lot of IBM Turbo Pascal
programs from him up in the Borland fourm on GEnie about 1990. That's
the last thing I remember seeing from him. I know he also did a little
work for the ST line.

"send HELP" is what you send a BITNET LISTSERV file server or digest mailing list so that a "FAQ" is automatically mailed back to you by the program that maintains putting addresses on and off of the subscription. It assumes that the mail packets are being generated by a "robot mailer" program. The poster is probably requesting: "information on how to post to the Texas mail gateway", "the help file for his news reader software (whatever it is)", "FAQ on this NewsGroup", "vendors list". I am not sure whether or not a "robot mailer" exists on this USENET NewsGroup to process "send requests". Does anybody know the answer to this one?

Source record: 103935

There are a couple of reasons that I have a lot of loyalty
towards Atari. First, my first Atari was a 2600 in 1980
when I was five years old. Since then I owned a 600XL,
800XL, XEGS, a Lynx, and now my STe. I grew up with Atari
and I have to admit to feeling a lot of nostalgia for the
company. Also, I have always felt that Atari deserved to
succeed. They have always come out with the BEST products
for the best prices (original ST, 130XE, Lynx, and now
the Jaguar). If superior products was the deciding factor
in a company's success, Atari would win hands down, IMO.
I also love the Atari community because of other Atarians
I have met. The small community lends itself to getting to
know others well. In no other platform would I be published
in a magazine (ST Informer :)) and be able to talk to
developers. Also, no other computer manufacturer supports
their 8-bit line (with the possible exception of Apple, who
still sells to educational institutions). To say that Atari
has not supported their products is a little harsh, I would
say. The 8-bit has had a long life. Atari also still
supports the ST (they will be putting money into the Falcon)
and they are also trying to breath new life into the Lynx.
I wish Atari had the resources that others do to give
the customer the support they deserve, but they just don't.
Oh well, enough rambling. I may not have good reasons to
be loyal to Atari, but I am!

4627. Composite monochrome monitor for sale

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-18 21:30:02 UTC
From: cohen@GOMEZ.phys.virginia.edu
Message-ID: <0097734B.99BC3960@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 103938
Cross-posted to: comp.sys.ti,comp.sys.atari.8bit,comp.sys.cbm

For sale-

Composite video monochrome monitors. Both have an RCA video input (no audio).
Screen size: about 10". They can be used with all computers that generate
composite output (Apple, TI-99/4A, Vic-20, Commodore 64/128, Atari 800/800XL,
IBM PC with older video cards, etc., where they are ideally suited for text-
intensive applications such as word processing, BBS'ind, Spread sheet
applications and the like, even at 80 columns),
security cameras, and similar applications. They produce a MUCH clearer
picture than composite color monitors (and are cheaper, too :-)

I have 2 units-

1. Zenith , amber screen.

2. BMC (Japan), green screen

I'll sell one at a time or both of them together,
please make a reasonable offer to me at the e-mail
address COHEN@GOMEZ.PHYS.VIRGINIA.EDU .

I was aware of the existence of the ComputerFacts mauals, however I have not
been able to locate a distributor (I live in Toronto, Ontario, Canada).

Any idea where they're sold?
Thanks..

>- Mike Jewison

And if you're _not_ handy with a soldering iron, it is much
simpler to just replace the whole board. The SIO port is part
of the power board and is very easy to replace and almost
as cheap. I've done it myself several times over the years.
Afer replacing the power board, then you can try your hand
at replacing and soldering the defective connector and feel
good whether you screw it up or not. There is NO soldering
involved with replacing the power board itself. Just alining
some pins and reattaching the RF cable. If you can plug in
an AC cord without difficulty, you can do this! Probably the
most difficult part of this is re-installing the plastic pin
that turns the 400 off and on when opening and closing the
cartridge cover. Simple to do as the rest.

Source record: 103952

Prudence would suggest that you have loyalty to no computer vendor. Fundamentally, they're all equally likely to stab you in the back. I have DEC, Toshiba, Tandy, Apple, Atari, AT&T, and NeXT computers. Of all of these, only Toshiba has been a 100% reliable vendor, but I almost never use the Toshiba...

Atari is one of those companies (NeXT is another) which have *never* been reliable throughout their history. I remember in 1982/3 having a talk with some Atari exec trying to interest him in some development tools/utilities. He rather coldly informed me that ``games is where the market is'' and that Atari was *only* interested in games. Yup, games like ET (easily the *worst* piece of computer software ever written). Needless to say, this fool was unemployed less than a year later...

I'm sure that the only reason why Tramiel didn't nuke the 8bit Atari machines was because they were cash cows to fund the ST.

What made the 8bit Atari machines great for their time was not the company, but rather the legions of dedicated hackers who bought those machines and wrote all the great software for it.

S > The Falcon is rumored to be carrying a game by Id Software called "Doom".
S >I have Doom for the Pc and I know that it is one of the best games going, and
S >that the Falcon will make it incredible.

From what I've been reading in the news leads, Doom is talked about for
the Jag...

If true, and Atari gets on the ball and produces several more adventures
in the Doom line (maybe with more puzzle solving and less killing) and
they do somthing smart like offer free or very very low cost developers
kits, and they build on the graphic engin that is Doom (hay, you can
create any world you want, just keep the engin in the cart and sell new
cd based worlds), they may just have a hit on there hands... The one
thing the Jag needs is a gimic... (when I first saw Sonic I didn't think
much of it, but look at it now..., take a lesson Atari!)

4635. [--- RN Help ---]

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-19 12:41:52 UTC
From: winston@merk.com
Message-ID: <CIA8Lt.6K1@merk.com>
Source record: 103945

(My news reader is crashing and I could use some help.)

To everyone... I need some help mastering RN or finding a suitable replacement. My problem is that the news reader that I am using can only hold 1499 NewsGroups in its ".newsrc" file. The problem is that in attempting to keep all of the "COMP", "GNU", and "BBS" groups together, I continuously run out of space. I see about twenty new "add" groups every time I start up "RN" on "comp.sys.atari.8bit". When the groups are added beyond 1499, "RN" crashes and I have to edit out new NewsGroups and store them so that they are not lost. Instead of trying to re-invent the wheel, I would like to ask what the common solution to this problem is. I assume that USENET users have a "standard" solution for this problem. Whenever I attempt to read the "news" dot hierarchy, I am completely lost, as it seems to contain "Call For Votes" and stuff like that.

Could anyone please offer me some advice? Should I have --SEVERAL-- startup files and use a shell script to move the "domain" I want into a ".newsrc" file and use ".newsrc" as a temporary working file instead of keeping it as a permanent file? Is a shell script hack the wrong approach to take? Is there some obscure "builtin" command in RN that aids the user in moving subscribed NewsGroup message pointer table files around? Is there a builtin way to move message number tables around or am I supposed to write my own? What is the proscribed method for doing this? There must be an easier method than starting up "RN", having "RN" kick me out, starting up an editor to store NewsGroups, then restarting "RN", every time that I want to read something. I don't mind whipping something up on the spur of the moment, but I am wondering if an "official" solution to this problem exists, before I start to try my own hand at this. Thanks.

P.S. Is there a reason for this 1499 NewsGroup limit? Would the solution to this problem be something simple like recompiling the source code with the limit set higher, or is that a bad idea (because of internal RAM space, etc.) ? I'm curious about what people have come up with.

4636. new clearance bundles!!

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-19 14:29:40 UTC
From: djg0@aber.ac.uk
Message-ID: <14152.9312191427@thor.dcs.aber.ac.uk>

DGS Clearance bundles and special offer bundles

==========

We are having a clearout at DGS HQ, and HAVE to get some stuff out of the way because we keep tripping over it! In order to get the stuff out of the way as fast as possible, we have decided to sell it in bundles and as cheap as possible. We now have *3* of the following bundles to dispose of (we found some more of them - it's amazing what turns up when you have a clear out!):

BUNDLE #1 (3 AVAILABLE):

****

ATARI MACRO ASSEMBLER, EASY PROGRAMMING FOR THE ATARI MICRO BOOK, DIGI-STUDIO (OLD PACKAGES 1&1.5. ALL SOFTWARE EXCEPT THE NEW LIDS SYSTEM - 2 DS/SD DISKS AND 2 MANUALS), ONE BACK ISSUE OF EITHER PAGE 6 MAGAZINE OR ATARI USER (THE BRITISH MAG.) OF OUR CHOICE.

All the software is BRAND NEW, except the mags which are used.

PRICE: JUST $20 PER BUNDLE

===

THIS PRICE INCLUDES SURFACE MAIL SHIPPING FROM THE UK! (THE PARCELS WEIGH IN AT 1.2 KILOS SO AIR MAIL IS NOT REALLY A VIABLE OPTION. IF YOU WANT YOUR BUNDLE SENT BY AIR MAIL THEN ADD $15 TO THE PRICE).

****

BUNDLE #2 (1 AVAILABLE):

****

AS ABOVE BUT WITH "ATARI 600XL PROGRAM BOOK" IN PLACE OF THE EASY PROGRAMMING BOOK.

PRICE: JUST $20 PER BUNDLE

===

SHIPPING ARRANGEMENTS AS FOR BUNDLE #1

****

BUNDLE #3 (1 AVAILABLE):

****

DIGI-STUDIO (OLD PACKAGES 1&1.5 - ALL SOFTWARE EXCEPT THE NEW LIDS SYSTEM.
2 DISKS AND 2 MANUALS), ATARI 600XL PROGRAM BOOK, A BACK ISSUE OF PAGE 6
MAGAZINE.

PRICE: JUST $15 PER BUNDLE

===

SHIPPING ARRANGMENTS AS BUNDLE #1, EXCEPT ADD $10 FOR AIR MAIL.

****

BUNDLE #4 (10 AVAILABLE):

****

THIS BUNDLE WILL GET YOU SOME CURRENT DGS PRODUCTS AT BARGAIN PRICES!

THIS BUNDLE WILL GET YOU THE FOLLOWING:

* A COMPLETE SET OF NEWS-DISK BACK ISSUES (1-14) ON 7 DOUBLE SIDED DISKS!
* THE RAMBIT/DGS PRODUCT "PRINT-FILER"
* THE "DEMO MAKER" SOFTWARE (COMPLETE WITH 14 PAGE MANUAL)
* THE RAMBIT/DGS PRODUCT "TASKMASTER" (TAPE TO DISK UTILITY)
* THE FULL CURRENT VERSION OF DIGI-STUDIO, WITH 2 DS/SD DISKS AND A 44 PAGE
MANUAL. COMPLETE VERSION 1.2 LIDS SOFTWARE.

THE USUAL COMPLETE SELLING PRICE FOR ALL THIS SOFTWARE IS $75, BUT AS A
SPECIAL OFFER YOU CAN GET ALL THE SOFTWARE LISTED ABOVE FOR JUST
$55 INCLUDING *AIR MAIL* SHIPPING!

===

(THAT'S A SAVING OF $20 ON THE USUAL SELLING PRICES!)

NOTE: WE WOULD RECOMMEND THAT YOU SEND THE CASH BY REGISTERED MAIL, OR BY
USING AN I.M.O (FOR 30 UK POUNDS).

NOTE 2: THERE'S NO NEED TO RESERVE ONE OF THESE BUNDLES. JUST SEND THE CASH
OR IMO WITH YOUR NAME&ADDRESS (AND E-MAIL ADDRESS) STRAIGHT TO US.

****

Ordering info:

First reserve a bundle by email: dx107@cleveland.freenet.edu. I only read and send messages from here once a week at weekends. I'm not ignoring you if I don't reply straight away!

Then send the cash direct to us at DGS. Paying in cash is the easiest way to pay. You can pay by IMO if you prefer but these cost a fortune to arrange.

If paying by IMO, then make it payable in UK pounds, for half the dollar price (slightly different arrangement for bundle #4 - see the bundle 4 info).

Our address is:

DGS

62 THOMSON AVE

BALBY

DONCASTER

DN4 0NU

ENGLAND

Note: It is important that you send your money as soon as we confirm that a bundle is still in stock. We need a rapid turn-around on this stock. Only reserve one if you REALLY want one. We have had problems in the past with people reserving stock and then never paying for it.

Note 2: please note our address now. We won't give it again when we confirm your reservation by email.

We will put your bundle in the post the same day your money arrives. Delivery by surface mail should take about 6 weeks to the US. Delivery by air mail takes about 1 week. We will also throw in a copy of the latest DGS catalogue of PD and commercial software.

Dean Garraghty.

DGS Clearance bundles and special offer bundles

==========

We are having a clearout at DGS HQ, and HAVE to get some stuff out of the way because we keep tripping over it! In order to get the stuff out of the way as fast as possible, we have decided to sell it in bundles and as cheap as possible. We now have *3* of the following bundles to dispose of (we found some more of them - it's amazing what turns up when you have a clear out!):

BUNDLE #1 (3 AVAILABLE):

****

ATARI MACRO ASSEMBLER, EASY PROGRAMMING FOR THE ATARI MICRO BOOK, DIGI-STUDIO (OLD PACKAGES 1&1.5. ALL SOFTWARE EXCEPT THE NEW LIDS SYSTEM - 2 DS/SD DISKS AND 2 MANUALS), ONE BACK ISSUE OF EITHER PAGE 6 MAGAZINE OR ATARI USER (THE BRITISH MAG.) OF OUR CHOICE.

All the software is BRAND NEW, except the mags which are used.

PRICE: JUST $20 PER BUNDLE

===

THIS PRICE INCLUDES SURFACE MAIL SHIPPING FROM THE UK! (THE PARCELS WEIGH IN AT 1.2 KILOS SO AIR MAIL IS NOT REALLY A VIABLE OPTION. IF YOU WANT YOUR BUNDLE SENT BY AIR MAIL THEN ADD $15 TO THE PRICE).

****

BUNDLE #2 (1 AVAILABLE):

****

AS ABOVE BUT WITH "ATARI 600XL PROGRAM BOOK" IN PLACE OF THE EASY PROGRAMMING BOOK.

PRICE: JUST $20 PER BUNDLE

===

SHIPPING ARRANGEMENTS AS FOR BUNDLE #1

****

BUNDLE #3 (1 AVAILABLE):

****

DIGI-STUDIO (OLD PACKAGES 1&1.5 - ALL SOFTWARE EXCEPT THE NEW LIDS SYSTEM.
2 DISKS AND 2 MANUALS), ATARI 600XL PROGRAM BOOK, A BACK ISSUE OF PAGE 6
MAGAZINE.

PRICE: JUST $15 PER BUNDLE

===

SHIPPING ARRANGMENTS AS BUNDLE #1, EXCEPT ADD $10 FOR AIR MAIL.

****

BUNDLE #4 (10 AVAILABLE):

****

THIS BUNDLE WILL GET YOU SOME CURRENT DGS PRODUCTS AT BARGAIN PRICES!

THIS BUNDLE WILL GET YOU THE FOLLOWING:

* A COMPLETE SET OF NEWS-DISK BACK ISSUES (1-14) ON 7 DOUBLE SIDED DISKS!
* THE RAMBIT/DGS PRODUCT "PRINT-FILER"
* THE "DEMO MAKER" SOFTWARE (COMPLETE WITH 14 PAGE MANUAL)
* THE RAMBIT/DGS PRODUCT "TASKMASTER" (TAPE TO DISK UTILITY)
* THE FULL CURRENT VERSION OF DIGI-STUDIO, WITH 2 DS/SD DISKS AND A 44 PAGE
MANUAL. COMPLETE VERSION 1.2 LIDS SOFTWARE.

THE USUAL COMPLETE SELLING PRICE FOR ALL THIS SOFTWARE IS $75, BUT AS A
SPECIAL OFFER YOU CAN GET ALL THE SOFTWARE LISTED ABOVE FOR JUST
$55 INCLUDING *AIR MAIL* SHIPPING!

===

(THAT'S A SAVING OF $20 ON THE USUAL SELLING PRICES!)

NOTE: WE WOULD RECOMMEND THAT YOU SEND THE CASH BY REGISTERED MAIL, OR BY
USING AN I.M.O (FOR 30 UK POUNDS).

NOTE 2: THERE'S NO NEED TO RESERVE ONE OF THESE BUNDLES. JUST SEND THE CASH
OR IMO WITH YOUR NAME&ADDRESS (AND E-MAIL ADDRESS) STRAIGHT TO US.

****

Ordering info:

First reserve a bundle by email: dx107@cleveland.freenet.edu. I only read and send messages from here once a week at weekends. I'm not ignoring you if I don't reply straight away!

Then send the cash direct to us at DGS. Paying in cash is the easiest way to pay. You can pay by IMO if you prefer but these cost a fortune to arrange.

If paying by IMO, then make it payable in UK pounds, for half the dollar price (slightly different arrangement for bundle #4 - see the bundle 4 info).

Our address is:

DGS

62 THOMSON AVE

BALBY

DONCASTER

DN4 0NU

ENGLAND

Note: It is important that you send your money as soon as we confirm that a bundle is still in stock. We need a rapid turn-around on this stock. Only reserve one if you REALLY want one. We have had problems in the past with people reserving stock and then never paying for it.

Note 2: please note our address now. We won't give it again when we confirm your reservation by email.

We will put your bundle in the post the same day your money arrives. Delivery by surface mail should take about 6 weeks to the US. Delivery by air mail takes about 1 week. We will also throw in a copy of the latest DGS catalogue of PD and commercial software.

I am looking to buy ANY old Atari equipment. I am new here to the internet. Please email me with your prices. I am also interested in the first 30 issues of A.N.A.L.O.G. magazine. My local library has searched the entire state of IL trying to find these to no avail. I have found these but the owner has them all sealed air tight in plastic bags and doesn't want to part with them or open them.

I'm sure there must be a version of RN that can handle more groups. Or maybe you should try trn, if it's available where you are. There's a command line option, I think it's -Q (check the manual), to run rn without checking for new newsgroups.

GIFNCODE will convert Atari picture files to GIFs. APCAVIEW converts
GIFs to various formats that the Atari can handle. COLRVIEW lets you see
.R, .G, .B picture files created by APACVIEW. These programs are all by
Jeff Potter, and should all be in atari.archive.umich.edu. (They all run
on the Atari. Does anybody know of a picture file converter that runs on
MS-DOS?)

If you want to prevent RN from annoying you with all
those "new newsgroups" messages and inflating your
.newsrc file to unmanageable size just put this
in your .rninit file:

-q

You'll never see another 'subsribe?' prompt again.
But you'll also see those wonderful (!?) new groups
that are created on a daily basis. You know, groups
like alt.fan.rutabaga and alt.sex.watermelons.

4644. Atari 8 bit stuff

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-19 23:44:53 UTC
From: taaten@cs.vu.nl
Message-ID: <CIB3At.3IA@cs.vu.nl>
Source record: 103806

Hello,

I'm looking for some atari 8bit items, such as:

- Books (Mapping the atari, De Re Atari etc. etc)
- Programs (especially spartados X cartridge)
- Assembler (Mac65 cartridge)

But overhere in Europe it's very hard to find those things
so if there are still companies in the USA where I can order
these items, please give me their address so I can contact them
(fax/phone numbers are also OK).

If there's anyone in Europe who knows where to purchase this in Europe
tell me !

Thanx,
Thijs Aaten (taaten@cs.vu.nl)

: they haven't been quite as bad in the past year, but I still feel they could
: support their products a lot better... what happened to the CD-Rom for the
: A600... oh yeah, we're not making that any more, so there's no point in
: supporting it... bit like Atari there. So at least this proves it isn't only
: Atari who are rubbish (this doesn't excuse either company however).

The C128 had it's points, but it's high failure rate (about 33% DIED within one year - parts burning out, etc.!) really killed it. I agree with the Amiga point though... if Atari had supported it, I still would've hated it... the early releases of the machine and it's supporting software was a joke. Over the years, however, it has evolved into a quite useful machine.

: It seems a shame that machines designed by people with vision are
: held back, or even strangled, just because of the company that happened to buy
: them (Commodore didn't design the Amiga, they just bought out the company who
: did).

I agree whole-heartedly! If Epyx had released the Lynx, for example... oh-well, too late for that. I loved some of their games, too! (Epyx that is.) They were just afraid to take on the Nintendo monopoly at the time... so Atari stepped in and botched it themselves. Atari actually tried, too! Nintendo just had a strangle-hold on the kids at the time. The Lynx was and is a professional job, Epyx deserves credit!

If your PC is an IBM class Intel PC, and you have a program written in BASIC that can print .PCX graphics captures, there exists a program written in ATARI BASIC called something like "ICONVERT.BAS" which reads and pixel maps files in: 1) MICRO-PAINTER 2) PRINT SHOP 3) NEWS-ROOM based formats. You could rewrite the IBM BASIC program to use these ATARI BASIC routines to, for example, place pixels from the MICRO-PAINTER data file onto the IBM screen using IBM BASIC calls in place of the ATARI BASIC calls. The ATARI BASIC program "ICONVERT.BAS" is -- interestingly enough -- surprisingly short. It only has to read a header and then start laying down the pixel bitmap. I was surprised at how short such programs are! I wish that the BASIC source code to MACREAD were also available so that routines to scan MACPAINT files could also be incorporated. There is also an ATARI BASIC program called something like "PICPRINT.BAS", which reads and prints GRAPHICS 7, 8, 9, (12 and 15 ?) format screen dumps. I truly wish that all of these picture readers could be combined or made into compatible multi-program template modules. The MICRO-PAINTER <---> PRINT SHOP <---> NEWS-ROOM format changer is a great beginning! I wish the concept was taken even further with MAC format, RLE format, GIF format. Still I suppose if everything can be converted into MICRO-PAINTER format, you can do "multi-step" conversions, "DEGAS PC1 ---> MICRO-PAINTER ---> GIF", etc. The nice thing about having a program in interpreted BASIC is that the soure code comes with the executible, so you can analyze and improve and expand the algorithms, even if the program does run a bit slowly.

Thanks for the tip! Hmm... but there are new NewsGroups that I
wish to subscribe to, such as new "comp." groups. Hmm... perhaps it
is possible to turn off --EVERYTHING-- and then selectively toggle on
hierarchy groups with "g" ? (I always wondered why they used "g"....)
Perhaps I could have everything "turned off" as the normal state and then
"turn on" specific hierarchies with an entrance macro and "turn off" the
groups again with an exit macro as I issue a "quit". Thank you. You have
given me several ideas. I just wish that I knew what the "correct USENET
method" for handling this problem is.... The MAN manual pages hint at
several advanced features within RN. I guess it is time to do some
experimenting.

I read somewhere, as well, that the name ANALOG was intended pun
because Digital Electronics Corp. had their headquarters just
down the road. This, of course, was when ANALOG was still located
in Massachusetts.

>two-button joystick on the 8-bit? What kind of output does it produce
>that makes it different from the left button, but other systems cant tell the
>difference?
>thanks..

The 7800 sticks use the two paddle control lines on the port for each fire button. But, to retain compatablity, the fire buttons are still attached to the normal fire button line via a 620ohm resistor.

Imagine this picture. You have the orange (I'm guessing, problay incorrectly that the controllers all used the same color codes.) wire for the normal fire button trigger. It attaches to one side of both buttons. The other side of each butter goes to the 620ohm resistor AND one of the paddle lines (each button use different paddle lines, I belive left button was pot1, and right was pot2). The other side of BOTH resistors go to the black wire (Gnd.)

The Resistor prevents a direct grounding, to provide a true value on the paddle, but is low enought not to stop a signal passing for normal operation.

Hope that helps.

I just received a mailing from CSS yesterday. There was some pretty interesting news on the 8bit front. The first is that they're working on a new product called 'The R:P: Interface'. Hmmm, that sounds vaguely familiar. Anyway, it is a high-speed modem and printer stand-alone interface for all 8-bit machines. The throughput is supposed to be high enough to use 9600 and 14.4k modems. The projected price is $59.95.

The other big news is that CSS will be carrying the line of ICD/OSS cartridges, which include MAC/65, Action!, Baxic XL and Basic XE. They also plan to again offer the original R-Time 8 clock cartridge. All these cartridges are expected to be available around March of 1994.

There was also mention of other NEW (emphasis mine) products due to a new 8-bit manufacturer, Fine Tuned Engineering. They have a holiday sale on most of their products including The Black Box which is good thru Jan 31st, 1994. CSS can be reached at (716) 429-5639, 10-5 Eastern Time. It's been a while since we've had good news like this.

4657. Fax Software

Newsgroup: comp.sys.atari.8bit

Is there any Fax Software for the 8-bit?
If not it would be a good project to work on for me. I need to find
out more about fax transfer protocols, and imaging....
Gumby@ace.com

OOH! OOH! I WANT! I WANT! I'll buy that 800xl for $30- how much would
shipping & stuff be, etc. etc... please don't reply, but mail me at:

phbill@cyberden.sf.ca.us or
phbill@cyberden.uucp

thanx a ton....
(I really need a new XL system esp. with a PBI port hehe)

Thankfully the 128D was designed much better than the original C-128. Mine's
been going strong since 1988.
I like the original Amiga myself (A1000). I've yet to see another computer
with the nifty keyboard garage. The OS was a bit (ok a LOT) unstable until
2.04.

Source record: 103817
Cross-posted to: comp.sys.atari.8bit,misc.forsale

Atari 800 (48k), internal cards in metal cases, keyboard in great condition, card cover has latches instead of screws

Indus GT Disk drive (Single, Double, and 1050 Density) in great condition, includes all cables.

Atari 410 Cassette Recorder

Donkey Kong Cartridge
BASIC Language Cartridge
Summer Games (Disk) game

I will immediatly take an $150, or the best offer by Jan 1, in an case the stuff will be sold.

Shipping is included.

Steve

Source record: 103825

Antic had an article on X-10 in the August 1988 issue (Volume 7, Number 4). There is a program for both ST and 8bit. The 8bit uses a product called "PowerManager". The addresses given at the end of the article are:

POWERMANAGER
Terrific Corp.
17 St. Mary's Court
Brookline, MA 02146
(617) 232-2317
$44.95, 48K disk (includes cable)
This device plugs into joystick port #2.

X-10 POWERHOUSE CP290
X-10 (USA) In.c
185A Legrand Avenue
Northvale, NJ 07647
(800) 526-0027
(201) 784-9700 - New Jersey

I haven't tried these addresses or phone numbers. I just typed 'em in from the magazine. Obviously, it's five years (plus!) out of date, so it might not be accurate. But these are the articles people are/were talking about, I think.

Also, for the real do-it-yourselfers, there is an article about X-10 in the December 1993 issue of Computer Craft. The article discusses the way X-10 works. A device that plugs into the parallel port of a PC is built. The schematic is supplied. The address for more X-10 info is given as:

X-10 USA Inc.
91 Ruckman Rd.
Box 420, Closter, NJ
07647-0420
(201) 784-9700

Hope this helps...

I've been looking into using Atari 800s as part of my home automation project. There has already been a fair amount of discussion about the X10 modules, so I won't go into too much more detail on that. However, for the record, each module has a configurable address that consists of a letter A-P and a digit 1-16. The TW523 module is a BIDIRECTIONAL module. You can use it to send out X10 signals AND it receives X10 signals that are put out on the power line by other modules (controllers). Hence, when interfaced to your computer, you can determine what X10 signals are flying around. This can be handy if you want to set up logical devices. Say for example you send out A10 ON from the controller in your Family Room, the TW523 hands that off to the computer, the computer maps it to A1 ON, A2 On 50%, A5 Off and the all the lights in the room shift to a different configuration.

So, enough of that. The problem with the TW523 is that you need to do some serious bit banging on the input to it to get the X10 signals out on the power line. There is a company called MicroMint that produces a chip called PLIX. This gives a parallel interface to the TW523. They may also have a serial version now. Micromint's order number is 800/635-3355. Call and have them send you some information on it. Make your own decision. I have the parallel version, but have yet to hook it up with the Atari.

Anyway, here is my plan for using the Atari 800s in my home automation project. I want to be able to sense a number, say 100 or so, switch closures, read & write X10 signal from the power line, and produce contact closures. I may also want to add IR input and output as well.

The current plan is to dedicate an 800 for each of the input tasks and have one master 800 that gathers those inputs and inferences based on that. The output of the master controller will be available to any TV in the house by use of 5 input 3 output RF switchboxes located in the basement. These are switched using solinodes controlled by, yes, an 800. Hence, I can sit down and interact with menus that are built on the TV screen using my X10 remote control. I want to log all X10 traffic since I know that we get signals from the neighbors (I can turn their lights on too :-), log furnace/ac run time, well pump run time, water heater run time, etc.

The inputs into the 800s will be handled through the joystick ports and will probably involve some minimal hardware. I've already designed and built the switch sensing board, have

it working, and have tied it into a display of the house
floor plan so as doors and windows open the display changes
to reflect that. I also plan on using the joystick ports
to put each 800 on a common bus to handle communications
between them. Its possible to hook them together over the
SIO connection, but I don't know how to do that, so, one
falls back to what they are familar with. I've been dicussing
the SIO connection with someone though, so its still a
possibility.

Now all I need is an Uninterruptable Power Supply :-)

I've got an Atari assembler/editor cartridge suitable for 800XL/130XE etc, still in box with supplied manual.

I sold my Atari 800XL a while ago to a games player, who didn't need the cartridge. If you want it, email me (shunt@uk.oracle.com) - I don't need any money for it.

A UK address would be an advantage as it would be cheaper for me to post it to you.

(Atari Newsletter and Lots of Games. Had to get that in.)
I'd be curious to find out where a lot of the old-time 8-bit
magazine folk went. Tom Hudson, Charles Bachand, Kyle Peacock,
Mat*Rat, Brian Moriarty, Steve Panak, BBC, all them folk.
I heard Hudson was working for Autodesk, after doing Degas
and big pieces of CyberStudio for the ST. Brian Moriarty went on to
work for Infocom and then Lucas film, writing Trinity and Loom (among
others) in the process. James Hague is writing console games in
Seattle, the lucky bastard.
Anybody know about any others?

Well, if you don't mean as in an MS-DOS GIF->APAC or CV converter, there's always "alchemy" - I'm not sure if it's PD/Shareware/Freeware/etc., but my high school had it last year and it was a dandy program! :)

As for 8bit GIF viewing, there's also DEGASReaD, and JView (Jeff!? Is that out yet? What's its status?)

Source record: 103836

Hiya,
I'd like to know - before I think of buying one - what would an 8bit look
like through an LCD video projector.
Would it look good? Would it artifact colors like a TV? Would it be good
enough for 80-column work? (80-col on big-screen - cool, I think!)
What is the minimal horizontal resolution needed? Is 320 enough?
(the 320 ones are really cheap, and besides, the Atari can't be finer than 320
pixels per line.)
And, to be more specific: I want somebody's opinion on the Fujix P-40U, P-401,
and P-701, all within the $300-500 range. Especially, how the Atari composite
signal would look like through these things. (oh, one more: Sharp XV-310P -
I like it because it's portable and Multi-system - what's it like?)
thanx for info.
Please Email!!!!!!

4679. Even more stuff for sale

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-22 03:01:16 UTC
From: Ordania-DM@cup.portal.com
Message-ID: <98980@cup.portal.com>
Source record: 103838

Hey, it's Christmas time! So here's a bunch of wonderful xmas presents
for all you Atari-8-bit-die-hards...

All the following items are for instant sale at the listed prices, however,
feel free to make an offer, I'm trying to get rid of this stuff without
throwing it out. I also have other items including a lot of books, magazines,
and paperwork (schematics, upgrades texts, etc); if you're interested in
these, let me know.

Price Hardware Item
150 Magnavox RGB Display 80 Monitor
100 XEP 80 Column Interface

100 Indus GT Disk Drive with Write Protect Modification
100 XF551 Disk Drive with 3.5" switchable EPROM. (with addition of 3.5"
mechanism, you can use 3.5" diskettes at the flick of switch)
85 XF551 Disk Drive
65 1050 Disk Drive

70 Atari 800xl
50 Atari 800 (Axlon 32k ramboard, 65C02 CPU)
40 Atari 800 (48k)
30 Atari 800 (Rev 1, no right cart slot)
20 Atari 1200 Motherboards (4, price is for 1)
15 Atari 400 (2, price is for 1)

25 Seikosha Printer (Atari direct connect)
25 Sega Light Gun with Atari Cable Converter (home made, works great)
15 CX85 Keypad
15 CX22 Trackball (2, price is for 1)
15 Voice Box
10 XM301 Modem
10 1030 Modem
5 1010 Cass. Drive (2, price is for 1)
5 410 Cass. Drive (2, price is for 1)

Disk Software Item
20 Mail Order Monsters
20 Ghostbusters

Cartridge Software Item
40 SpartaDOS X 4.20
25 Rtime8 (needs new battery, has battery holder,
battery not SOLDERED in!)

20 Action
20 BasicXL

10 Atari Assembler/Editor
5 Atari Basic

15 Robotron
15 Adventure Creator
10 Serpentine
5 Computer Chess
5 Jumpman Jr.
5 Gridrunner
5 Submarine Commander
5 Atari Artist
5 Educational System

Prices do not include shipping. Shipping costs are rounded up to the nearest dollar. All items are for sale to the highest bidder, any offer will be considered, and any order must be sufficient to make me want to wrap it all up and bring it to the post office. (No, a $5 cart is not enough. :)

Feel free to contact me through one of the following:
Home phone: (203) 567-3082
Internet: OrdaniaDM@cup.portal.com
US Mail: Chuck Hughes
239 Brush Hill Rd
Litchfield, CT 06759

My home phone is the quickest way to reach me, but I do check my email about every other day.

Dear Netters,

Here's wishing you all the best in the festive season, and for the coming New Year.

Christmas means different things to different people.....presents for some..... religion for others.......and party time for the rest.

I am not a Christian, but do believe in God. As this is a celebration for the birth of Jesus, I too celebrate Christmas. I believe that all the religions teach the same thing, and so there should be no difference between people of different religions.

Basically, all religious teachings come from the one great power, so all religions must be the same....just preach it differently.

So, let's celebrate Christmas, with love and goodwill for one another.

Peace.

Danny.

In cleaning out my Atari stuff, I found 4 books that may be of value to someone.

SAMS Computer Direct "Programmer's Reference Guide for the ATARI 400/800 Computers" 495 pages, spiral bound.

"The Master Memory Map for the ATARI" 361 pages, paperback.

"Games, Graphics and Sounds" 144 pages, paperback.

"Understanding Atari Graphics" 48 pages, paperback.

Anyone who is interested please leave E-mail to me by Jan. 5 (at which time I will return from Christmas vacation). I want at least the postal cost for these books. I can split them up if someone really needs just one.
Thanks

Larry Elie

BTW, I forgot to mention a small point about actually reading the 7800 sticks. I belive it will involve changing the data direction of the ports. If you just try reading the paddles, you get no change of value. I'm not exactly sure at what the 7800 does at power-up, but it checks the ports, and determins what stick (true dual button system like a 7800 or compatable), or standard. And you can't change stick types mid-stream. So it does change something on the port depending on stick type.

One of these days, I've got to hook a logic probe up to the 7800, and see exactly what it's doing about data direction.

I've only had an 800 for abouy a year (give or take a month), and haven't done much programming. Only programming I've done is on the Commodore, and they don't have data direction options on the joy/pot ports.

I have an Atari 800XL with the 256K memory expansion. Please don't ask me what kind it was - I don't remember, but it was one of the more popular kits available at the time.

My question: Can I use this memory for anything more than a ramdisk? Can it be accessed from ROM Basic?

4688. Hey! Modem knowledge needed!

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-22 18:38:58 UTC
From: maestro@cybernet.cse.fau.edu
Message-ID: <NZ3yec2w165w@cybernet.cse.fau.edu>
Source record: 103847

I have a 2400 baud USRobotics modem, and currently I am trying to
actually use it with my 850. Bobterm will load the handler from the 850,
so no software handler is necessary. I got a 9-pin to RS232 converter
leading from Port 1 to the modem's back.
Here are my symptoms:
Everytime I try to connect normally, the modem hangs up after the
call was placed.
The modem will not respond to any commands on screen in Terminal Mode,
but all AT commands are put through to the modem and executed (with no
reply on screen).
When I force a Carrier Detect and a DTR signal, the modem seems to
respond to a BBS alright, with the cicking and buzzing 'n all. But they
wont handshake... its tres annoying.

Any help appreciated! Email, please, as I dont get here often...

I managed to trash my only SpartaDOS 3.2 floppy while trying to install it on
my hard drive before (this is a real no brainer) backing up the disk. I
basically put a comma in the copy command which for some reason trashed the
directory. I got my copy of 3.2 from Toad, who ended up sending me a copy
of the 3.2 disk on an unprotected floppy because they couldn't find the
original. I have the original 1.1 and 2.3 disks and the 2.3/3.2 docs.
I also didn't have the presence of mind to write protect the disk :(.
I was able to sit down with the Sparta manual and figure out enough about
the file format to be able to reconstruct the 3.2 binary, so I haven't been
totally sunk, although my Sparta 3.2 binary is now exactly 13000 bytes long.
(It apparently just loads zeros into memory location zero over and over
again for the extra bytes). Would anyone be so kind as to email me:

a) an arced and uuencoded set of 3.2 utilities
b) a diskcommed, arced, and uuencoded image of the 3.2 disk

or

c) a uuencoded copy of the first dozen sectors or so of the 3.2 disk?

(the last is the minimum I need to reconstruct the silly thing)

Brent

Hi.

I don't know if you'll get this but I haven't seen any mention of Vanguard for the 8bit computers anywhere. I'd want it too if it did exist. As far as I know it was only produced by atari for the 2600, and maybe the 5200 as the game was licenced by atari in late '82 or in'83.

as for the game you couldn't remember I think it was called "spare change" and produced by broderbund if memory serves. It was about the player being an arcade owner trying to control some mischevious arcade machines of various types.

Bfn,
James

BASIC XE has the ability to access your expanded memory for use in your
BASIC programs, especially when they get over 30k or use up a LOT of
variables.
I dunno with standard BASIc though.

c >
c >My question: Can I use this memory for anything more than a ramdisk? Can it
c >be accessed from ROM Basic?

While there arn't that many, there are a few programs that do support the
added memory...PaperClip, SynFile+ and SynCalc+ to name a few (that I use).
There are several others, and a few shareware programs that use the
extra banks of memory for graphics storage.

You can get at the extra memory from basic, PabQwk v1.2 (written in Turbo
Basic) does it, using the added memory for indexing. Its just not easy...

There's been a number of articles in old issues of Analog and Antic as well
as newer stuff in Atari Classics...Also, there's a good overview in the
revised addition of Mapping the Atari....

Sorry I couldn't be much help.

m >respond to a BBS alright, with the cicking and buzzing 'n all. But they

Hmmm, sounds like a problem I had when I added an Intel 14.4 to my 8bit...
When I'd try and connect to some boards, the modem would drop the line
at the first key press..., sound something like your problem.

In my case it turned out that some older modem just won't connect with
newer modems that try to connect with compression enabled. The answer
was to disable the compression when calling these boards (in fact the
one I'm calling now is one of those boards). To do this, in the term
mode type, AT\N0 This will turn you modems compression (V.32 and MNP) off.
To turn it on again, type AT\N3.

Now, something maybe others might like to know... I know alot of folks
who call board using one program (like Omnicom or K65) but like to switch to
another to do their downloading (like BobTerm for Ymodem). On some modems,
if you have to hit the reset (Omnicom) to exit the program (Omnicom Q command
locks up on me for some reason...) Newer modem will want to hang up... The
way around this is to disable the DTR... Again, in terminal mode, type
AT&D0 (owners of older modems may want to check there books for the proper code
here). Now you can login in Omnicom or K65, do all your reading in 80
column mode and switch to Bobterm for Ymodem downloads.

(I thought I was the only one who did this till I read Jeff McWilliams piece
in a past Atari Classics!)

Not without any assembler utility. Roland Buehler wrote a small
assembler program (I made it a bit faster), which helps you using the
extra RAM in blocks of 64K - you can copy it from the normal RAM into
the expansion with one 'USR'-command (the speed is about 40KB/s).

The final version is in a modified OS, so you don't have to load it
from disk (of course this OS has more features...).

Bye,
Jochen

Sigh.

I've seen everything now. We had this discussion some months ago about the ethics of obtaining pirated software when it was no longer commercially available. I think the general concensus was that it's an extremely grey area. And then along comes this guy advertising pirate copies of a software package which is in extreme demand and which will, if all goes well, become commercially available yet again.

It was reported on the net a short while ago that someone had bought the rights to the 8-bit line from ICD, including SDX. Many people are bemoaning the fact that developers for the 8-bit are dropping like flies, and yet here's a guy who's willing to put his money on the line that the 8-bits are still commercially viable. If we start forking out money to software thieves, which is what all these guys are, his market will evaporate, another developer will drop by the wayside, and we will have helped drive another nail into the classic Atari coffin.

I would urge all of you not to support these leeches from Poland. If you really want to get a copy of SDX, wait. We've been waiting almost two years for someone to pick up where ICD left off; another couple of months ain't gonna kill anyone.

I feel very strongly about this subject and I would hope that many of you do as well. It's only by supporting *LEGITIMATE* 8-bit developers that we can hope to maintain the viability of our machines. Parasites like these will eventually sound the death knell of our computers.

All this, needless to say, IMHO.

On an old keyboard/terminal/rf modulator setup I had a lot of interference with, I ended up trying a CB interference filter in the rf line to the TV. It worked. Might be worth a try here. The one I see currently listed in Radio Scrap is different, coaxial, part number 15-579.

Why is it more illegitimate for someone to copy cartridges and market them without paying fees than for someone to copy them because they have paid a fee? Legally, I know the answer. Also, I know that the Polish cartridges will be cheaper, which will mean (presumably) that more people will buy them, especially us folk in Europe who tend to get neglected on the Usenet. What my point is, some bloke has bought the license for a product, but he has not DEVELOPED the software any more than the Polish pirates: if the Polish had bought the license for a penny, they would not be pirates, and for some reason it is totally acceptable to buy a piece of software and market it to make a profit, regardless of how much you paid for the license compared to how much you're selling it for.

I hope this is a new slant on the argument and I shan't get the same normal moans, which I know about and generally agree with. Some of you will know that I produce PD software from time to time which generally is passed on without any money getting back to the club for which it was originally written, which might make your argument somewhat more interesting.

Updated 12-23-93 (some stuff sold, more stuff added)

Hey, it's Christmas time! So here's a bunch of wonderful xmas presents
for all you Atari-8-bit-die-hards...

All the following items are for instant sale at the listed prices, however,
feel free to make an offer, I'm trying to get rid of this stuff without
throwing it out. I also have other items including a lot of magazines,
and paperwork (schematics, upgrades texts, etc); if you're interested in
these, let me know.

Price Hardware Item
150 Magnavox RGB Display 80 Monitor
100 XEP 80 Column Interface

100 Indus GT Disk Drive with Write Protect Modification
100 XF551 Disk Drive with 3.5" switchable EPROM. (with addition of 3.5"
mechanism, you can use 3.5" diskettes at the flick of switch)
85 XF551 Disk Drive
65 1050 Disk Drive

70 Atari 800xl
50 Atari 800 (Axlon 32k ramboard, 65C02 CPU)
40 Atari 800 (48k)
30 Atari 800 (Rev 1, no right cart slot)
20 Atari 1200 Motherboards (4, price is for 1)
15 Atari 400 (2, price is for 1)

25 Seikosha Printer (Atari direct connect)
25 Sega Light Gun with Atari Cable Converter (home made, works great)
15 CX85 Keypad
15 CX22 Trackball (2, price is for 1)
15 Voice Box
10 XM301 Modem
10 1030 Modem
5 1010 Cass. Drive
5 410 Cass. Drive

Cassette Software Item
10 Tanktics

Disk Software Item
20 Mail Order Monsters
20 Ghostbusters
20 Seven Cities of Gold
20 Ultima II (no cloth map)
20 Spy vs Spy I & II

15 Archon
10 Murder on the Zinderneuf
10 Antic Mapware
10 Antic Rambrandt
10 Visicalc
10 File Manager+
5 Lepus Revenge
5 Superman the Game

Cartridge Software Item
40 SpartaDOS X 4.20
25 Rtime8 (needs new battery, has battery holder,
battery not SOLDERED in!)

20 Action
20 BasicXL
10 Atari Assembler/Editor
5 Atari Basic

15 Adventure Creator
10 Serpentine
5 Computer Chess
5 Jumpman Jr.
5 Gridrunner
5 Submarine Commander
5 Atari Artist
5 Educational System

Books
20 Inside Atari DOS (2, price is for 1)
20 Atari Basic Source Book
15 The Atari Assembler
15 Hackerbook (EPROM Burner docs, DCB usage instructions)
15 Program Descriptions (for Hofacker software - EPROM burner, joystick
serial port, joystick printer port)
15 Compute's Second Book of Atari (Forced Read Mode, Display List
interrupts, Fun with scrolling)
10 Basic Exercises for the Atari
10 101 Basic Programming Tips & Tricks
10 Atari Programming with 55 programs
5 Understanding Atari Graphics (small booklet)
5 How to use Atari Computers (small booklet)
5 The book of Atari Software 1983

20 Second Book of Machine Language
15 Machine Language for Beginners (2, price is for 1)

20 6502 applications (Rodnay Zaks - hardware programming oriented,
includes info on 6520,6522,6530,6532, and MC1408 (DAC))
20 6502 assembly language subroutines (includes 6522 reference,
subroutines for interrupts, multipliation, division, etc)
20 6502 Assembly Language Programming (includes info on 6520,6522,6530,

6532, 6850, and 6800 (CPU))
20 Top-Down assembly language programming for the 6502 (including Atari)

Texts
30 Original 400/800 notes (2 inches thick, includes schematic of
'Colleen' original code name for Pokey.)
20 130XE Addendum
15 Atari XL Addendum

Prices do not include shipping. Shipping costs are rounded up to the
nearest dollar. All items are for sale to the highest bidder, any offer
will be considered, and any order must be sufficient to make me want to wrap
it all up and bring it to the post office. (No, a $5 cart is not enough. :)

Feel free to contact me through one of the following:
Home phone: (203) 567-3082

Well.. If you're sick of your BlackBox, I'll make you a trade for it...

How about say.. umm. My 256k MIO and a 30meg MFM hard drive and a MINT condition 130xe? That way, you still have a HD interface, additional ram, a print buffer, a modem port, more HD space and a shiney new computer.

No, I'm not kidding!

I'm just wondering how trustworthy it would be to mail ANY money to Poland in the hopes of even getting any type of product back.

Whats the chance that the money wont just be taken?

At any rate, I left that person mail indicating that the SDX cart would probably be released for commercial sale again. We'll have to see if this continues.

Ah, I haven't an 8-bit, but forward messages to friends who do, I also check the archive for them ocasionally to see if there's anything new, they asked me for descriptions when I gave them your list. I'll go to the archive and get them for them. Thanks

You know, on second read, sounds like you've go a miss matched cable, the 850
has a non standard port, if you're trying to use off the shelf cables, likely
the system won't work. Either you're going to have to read the pin outs
in the book and build a cable of your own or you could just order one from
places like Best Electric and American Technavisions...Check out the
ventor's list that's posted from time to time.

t >YOU AREN'T USING A TV... MONITORS ONLY PEOPLE!!! If anyone's gotten one to
t >look HALF-WAY decent (display-wise) using a TV, how'd you do it? Wrap the

Well, I too just got my hands on a BB/FB combo... and yeah, it's got a few problems that I didn't expect... Out of 6 system (3 800xl's and 3 130xe's) only one 130xe works right with the system. The other 5 can't call up the conf menu, task master, monitor, etc. Yeah, if I short the 3.5" drive, I can get the 800xl's to boot the conf menu, taskmaster, etc... Still, I get no noise on the Tv I'm using and I don't have any shielding...

Still, I do like the way it works, seems a bit faster getting data off the hard drive than the mio, and I can use the Syquest drives with it though, with 1.44 meg floppies, it's almost the same.

Da** that's a good deal...still, I'd keep my BB, I could get real used to
being able to read/write IBM/ST, and have a mini 1meg replacable...
Still, wish I had something to trade for the MUX...though I did tell Puff
that was next on my shopping list, might even pick up one of te R:P:
conections in March.

Take care

My home phone is the quickest way to reach me, but I do check my email about every other day.

Here's another section of stuff that someone may be interested in, I guess you could call it the "Where'd THAT come from?" section.

MAO Apple II with monitor, cpm card, and 80 column card, AND
Applesoft basic programming reference manual, AND
Applesoft tutorial, AND
Micro on the Apple volume 2 (no diskette), AND
Apple II programmers handbook

MAO Gemini printer USER's MANUAL (not the printer)

MAO MC6809 Cookbook

MAO Commodore 64 Users Encyclopedia

MAO stands for MAKE AN OFFER. I hate throwing stuff out, but I'll do it...I swear I will... :) [If nothing else, the Apple II is worth the chips. :)]

>... I can use the Syquest drives with it
>though, with 1.44 meg floppies, it's almost the same.

We sure are on a different scale than most of the rest of the world. 1.44 meg is a lot of storage for an 8 bit. It really is the equivalent of a Syquest for other machines.

When I got my first XF551, I was pretty excited about getting 360K per floppy, and some IBM snob overhead me. He laughed histerically at me for being so excited over what he considered such a tiny amount. And yet, I could certainly stuff way more programs on these disks than he could put on one of his 1.44's.

I still like having a machine that doesn't take a 40Meg hard drive just to boot the operating system.

I couldnt agree more. Sadly enough, I have a 386dx with a mere 40meg hard drive and you cant fit ANYTHING on 40meg on an IBM compat..

I put Windows 3.1 on that disk and now I'm down to a mere 22 or so remaining meg of hard drive space -- and thats just the GUI!!!! -- Not to mention sticking Procomm for Windows and other utilities on it.

To just get the "Basics" (term program, word processor, etc..) - you're looking at somewhere around 60+meg! Unreal!

Ug! Dont mean to be rude here, but your prices are a bit extreme.

A few weeks ago, I was asking $65.00 for 256k upgraded XL's and XE's, and here you are asking $70.00 for a stock 800xl and $100.00 for an INDUS GT - when I was selling my Indus's for around $35-40.

Hard to believe you're selling anything at those prices -- thats downright gouging!

4725. Looking for upgraded 800

Newsgroup: comp.sys.atari.8bit

Even though I'm running 1meg upgraded XE's with Freezer switches and all the audio/video upgrades imaginable, I suddenly felt this overwhelming desire to get my paws on an old 800 - but preferably one with a bit more ram than 48k - as I'd like to use SpartaDos 3.2Z (MUX) and such.

I think I'd like to put one of those tanks to use as a dedicated MUX slave and use it only for word processing, etc..

Anyone having such, please contact me and we'll work something out -- cash or trades.

4726. Putting the 8bit to good use!

Talk about being "INTO" the Atari 8bit..

I'm running 4 8bits right now on a multiplexed system (all accessing the same peripherals [hard drive, printers, floppy drives, etc..])

And now I'm about to run about 40 foot of 34pin ribbon cable under my house so that I can have a dedicated recipe and shopping list machine for use by my wife.

Imagine it.. Built right into the counter top is a machine tied into a hard drive and database - and readily accessible for menu recipes, a shopping list database, etc.. -- all tied into my printers, etc..

Search for delicious dinners, check your kitchen food inventory, print out a price-list of groceries needed - all from the kitchen!

I'm going to be doing the install next weekend. Ought to be awesome!

Quoting John Harris

j >We sure are on a different scale than most of the rest of the world. 1.44
j >meg is a lot of storage for an 8 bit. It really is the equivalent of a
j >Syquest for other machines.

If I've used 2meg on my 10 meg HD I'm luck... Every thing I use, Action!
lib's, Mac/65 lib's, TextPro, Speedcal, etc... AutoCad 12 on my clone
take up 30 meg just by itself and that's not counting the 20meg Windows's
takes up...and thats jsut the tip of the burg..

j >When I got my first XF551, I was pretty excited about getting 360K per
j >floppy, and some IBM snob overhead me. He laughed histerically at me for
j >being so excited over what he considered such a tiny amount. And yet, I

Felt the same way when I got the ATR with 4 drives, 2 360k and 2 720k 3.5's,
it's still a lot of space to me...

I see these guy's who go out to thier local CompUSA and pick 'em selves up the
lates super ultra max high speed wiz bang ram up to here computer...for what,
yeah, DOOM! Then they panic when it comes time to install that super sound
blaster card (lots of things to set in the config file). I guess what I'm n
getting at is, these same people that would look down there nose at an Atari
just because of it's name likely don't know the first thing about their owncomputer of
choise other than how to turn it on and who to call for help...
Yeah, me...a lowly Atari 8biter...can't tell ya how many times it's
happened. Optimizing an IBM system is just a bit harder than using the
setup found in Dos 6...Maybe being a small platform owner since 83
has help me to see things and be just a bit more system aware...Nah! ;>

j >I still like having a machine that doesn't take a 40Meg hard drive just to
j >boot the operating system.

Ah! A Mac person!... System 7.1.1 (the version that must be loaded from
cd)... I just love multimegabyte operating systems!

I had my 6.0.7 down to just 450k (only?).

Mikeonly O.S. I've not used is OS/2 2.1 - Did like NeXT step though, interested
to see what it's like on the 486 (another 20+ meg operating system!)

K >To just get the "Basics" (term program, word processor, etc..) - you're
K >looking at somewhere around 60+meg! Unreal!

As I've been lead to understand, the min rec-o-mended hard disk (Byte Mag)
is 210 or better... Just set up and office the other day, their system
only had an 80 meg drive, after Windows 3.1, WP 5.1, Twin, PeachTree 7,
and a few other misc programs (Norton, QD3, etc) there was something
like 15 meg left... If they upgrade to all windows compat software, we're
looking at needing at least a 210 and maybe a 370... (and all my stuff
fits in just 2 meg on my 8bit!)

Mike

Whew! And I thought I was the only one... this was just too outrageous for me to comment on. Some software sounds ok... although much of it sold NEW for the same price BACK IN THE OLDEN, GOLDEN DAYS OF ATARI. Ouch! The drives, ugh, close. The computers, hmm, I seem to recall them selling NEW for better prices in 1988/89! Wow, that's saying something. Some poor guy was having problems selling a 1200xl AND a 1050 drive a few weeks back for $65!!!

To be fair, recently I have seen new browsers/sellers to this group asking up to:
$40 for an 800xl
$30 for a 1050 drive
and yes, three, count 'em three people selling Indus GT's with case and all software for $49, 50 ,and 39 respectively.
Monitors ranging from $15 to $60 (possibly one 75 if I recall).

Wince... owww... please consider dropping the prices a bit, it hurts to watch these msgs, especially around Christmas time... wince...

I know this may get me flamed, but it seems that this thread is looking
it's nose down at the IBM systems. Maybe being interested in micros since
1978 (and computers since 1968) gives me a different perspective, but
it seems to me a given that the size of the operating system and available
hard drive space correlates much more with the cost of hardware than with
anything else. My first system (resting in the cellar for now) had
4 K memory boards which ran something like $200 each. Now less than that
gives you 4 megs of memory. It's floppy drives ran $900 for two drives
giving all of 90K each (or something like that), now $900 would buy
one gigabyte of hard drive space. Why shouldn't people USE the power
available to them at what seems to be the acceptable price tags of $500

to $1500 or so?

Sure, we may have more of a historical perspective on things than newcomers, but snearing back at people only alienates both sides. One uses what one is most familiar with, and whatever a person USES is the best system for him. I will admit that I am horrified at the install sizes of many DOS windows packages, but I keep reminding myself that a ten meg program is only using ten dollars worth of hard drive space. Lets see, at $900 for 180K on my first system, that would be the equivalent of a 2 K program on that operating system. And I recall having several programs as large as 16K or so. Nowadays that much hardrive space would buy a full development system for Windows with all the bells and whistles. Certainly much more bang for the buck.

>j >I still like having a machine that doesn't take a 40Meg hard drive just to

>to see what it's like on the 486 (another 20+ meg operating system!)
>

Hmmm ... I am reminded .. that system was my first system ... my second was a Netronics Elf with 256 bytes of memory ... amazing what one can do in a tiny amount of memory if one doesn't have the luxury of floppy drives and secondary storage. All you people talking about actually having tape storage or <gasp, argh> floppy drive! With more storage than memory in the machine? What can you possibly do with all that space?

Now that system more than paid for itself, which is more than I can say for any of the other systems I own. Of course, if the money is plowed back into the system, does it really pay for itself?

And 370 megabytes is about $300 dollars ... less than a single floppy drive was for the Atari in its hey day. Let's try to keep thing in perspective, hardware is getting cheaper every year.

Ponder this if you will. A video storage media uses something in the vicinity of 3 megs plus per second (net storage needed, after any compression, with an order of magnitude proviso). So a 90 minute feature uses 15.4 gigabytes of storage, yet we think absolutely nothing about it cause it fits on a $2 tape. Are we still going to be aghast at the size of operating systems in the megabyte range when hard drive storage is this cheap? And it will be. Right now cost is about $0.80 per meg (in the $400 range people seem to enter at), and still dropping at a rate of about 50 percent every 2 years. So in 20 years, when I am ready to retire, and my son is raising his family, cost will be about $0.80 per gigabyte. Or less (50 percent evey two years is conservative).

Heck, a single high quality GIF of Christie Brinkley takes up more storage space than ten Atari floppies. Does that mean that people who wish to store such GIFs have their priorities backwards? It is costing them less to store it on hard drive than it did for one third of a floppy disk back then (remember when Single Sided disks were $30 for ten?) Indeed, it is costing them about the same to store it on hard drive as it would to take the picture, process it, and have the print made.

I haven't heard anything else yet myself... I did some heavy checking late last night but couldn't turn up anything on it. There was another company kind of cross-marketting some of ICD's old stuff with Bob of C.S.S., but last I heard, the SpartaDos-X cartridge wasn't coming back. Could someone please contact this other person... I think the company name is "Fine Tuned Engineering"... and find out if he decided that he WILL be carrying that long gone item??? Does he have an email address??? (hopefully - most 8-bit supporters such as old retailers, developers, etc. never get into the world-wide internet... it's a shame... kind of limits support of those old workhorses!)

Ah-ha! Someone else has noticed the big looming problems in the IBM and Mac world as of late. Optimization! The old Atari's and the like were severely limited by the small operating memory of a STANDARD machine (48 or 64k). Software designers had to limit some aspects of their design, but for the most part went ahead with the full implementation, choosing instead to reduce code size whenever and wherever possible. In most of the newer software packages I've come across on various multi-megabyte systems, the programs for the most part run quite fast and smooth, but take up several megs of storage space AND memory when running! They tend to be quite sloppy on exiting (windows for instance on a PC) leaving bytes set here and there, or entire code segments lying about, sometimes even ALLOCATED still! I've seen DOOM... for 320x200 graphics... ok... choppy still, but ok. But COMPRESSED it takes 2.6 Meg of space, and to run requires a 386 with 4meg of memory!!! Yiieeee... anyone remember Alternate Reality, from Datasoft? The Dungeon would run as much as it could (fairly efficiently too I might add) in a stock 48k 800 with one drive, BUT it would allow the user to add up to 3 additional disk drives AND would use 128k of memory if the system had it!

(Guess I wandered away from my original followup, sorry)... I HAVE a few demos on my machine that are simply incredible, phenomenal sound, graphics, and animation... but only take a couple K of disk space and 16k of memory to run... Anyone remember Lucasfilm?? Rescue on Fractilus? Ballblazer? Very good, well-thought-out programming - tight code! I could see something like this taking 300-500 k using the "modern" patch-code programming styles I've become familiar with seeing on the IBM's and Mac's... ugh... getting tired, rambling again... sorry...

t >'ole Black Box. It's history as of Monday. It's just not worth the tv
t >interference problems, disk access slowdown, printer interference, etc...
t >it's an interesting piece of work, but far from worth the $309 asking price

Man, I'm sorry to hear that things didn't work out for you, one thing though,
printer interference? I've been using mine for a while and (while I still
can't get the conf menu to come up...) I don't seem to be having any problems
with the printer or the spooler... Let me know what is happening so I can
keep an eye out for it.
I'd heard the story's of the plastic black box, I think it was in znet
around 89/90 or so. Mine is just the bare board, in the not too dist.
future it should end up inside a mini tower case along with an expanded
XE and a 40 meg drive.

I did notice the stall as the system checks the drive, but it's not bad when
using the 3.5 or the Hd... its kinda like what SDX does when you have
the prompt set to $L:$P>... we've called it "Burping the drive"

Mike

r >I know this may get me flamed, but it seems that this thread is looking

Don't know about "Flamed", not one of the things I'm really good at, but
ya might of missed the point...

r >it's nose down at the IBM systems. Maybe being interested in micros since
r >1978 (and computers since 1968) gives me a different perspective, but

no, not the systems, its the folks that don't take the time to learn...
it sounds like you, John, and myself have worked our way up with these
systems, not just 8bit, but computer systems in general... Yeah, I don't
take it well (that may not be the right way to say it) when someone who
really dosn't know what there talking about comes down on something just
because of system name... Windows and Atari are two examples...and yeah,
I use both...(as well as a Mac+, II, 610 & 950, a NeXT cube, a IIe, C=128
C=128D etc.)...ya know, I got too many computers here maybe I should pitch
my TRS80 mod3... Nah! ;>

r >it seems to me a given that the size of the operating system and availabler >hard drive
space correlates much more with the cost of hardware than with
r >anything else. My first system (resting in the cellar for now) had
r >4 K memory boards which ran something like $200 each. Now less than that
r >gives you 4 megs of memory. It's floppy drives ran $900 for two drives
r >giving all of 90K each (or something like that), now $900 would buy
r >one gigabyte of hard drive space. Why shouldn't people USE the power
r >available to them at what seems to be the acceptable price tags of $500
r >to $1500 or so?

All of this is true, still, just because the cost per meg has droped as
production of drives has increased, does not mean that every program needs
to become 10 times its original size. Having been a Mac developer, I can tell
some of the code produced was quite sloppy...(Med software for the Med
schools here in Louisiana).

I don't know, I started with the old A65 board computer...no drives, an 8
character display and a thermolprinter...yeah, it did have a build in e-prom
burner...guess that was kinda like a drive...and only 256 bytes of memory...
it made ya learn how to work with-in limits.

r >Sure, we may have more of a historical perspective on things than newcomers,
r >but snearing back at people only alienates both sides. One uses what one

You make this sound like the days when an Atari owner would look at a C= 64
owner and kringe... That's not what I ment to say... What bug's me is
people who will put down a thing with out knowing anything about the subject.
If this only alienates people, then I don't know what to do, but I da** sure
am not going to listen to this person or give any weight to what they have

to say...guess is some folks eyes that makes me short sighted...then so be it.

r >Hmmm ... I am reminded .. that system was my first system ... my second was
r >a Netronics Elf with 256 bytes of memory ... amazing what one can do in a
r >tiny amount of memory if one doesn't have the luxury of floppy drives and

Didn't-cha just love 'em days, a group of us expanded the A65 to handel
4 K-bytes...Yeah, we were taking about making a database program cause
we had so much memory. The whole program took up just under 2K, but ya
couldn't really update your data once you'd burned it on the second
prom... Dumb, I know

r >And 370 megabytes is about $300 dollars ... less than a single floppy
r >drive was for the Atari in its hey day. Let's try to keep thing in
r >perspective, hardware is getting cheaper every year.

and the cost of the 486 I just got droped $200 30days later... so?
people who've not come from the same background as you, John or I
also thing that the size of programs has just gotten out of hand...
Yeah, you're right, there's nothing we can do about it. Still jst
because the cost per meg has droped below a buck, I don't need some
developer setting back and writing 100meg programs because it's easer
for 'em and what the heck, you can by bigger stuff...after all, computer
folk can afford storage at $1.50 or $2 per meg... thats the same logic
they use for gas prices

(very true stuff about vcr tapes cut)
doing a backup to video tape in 6hr mode is a drag...I've done it...

r >space than ten Atari floppies. Does that mean that people who wish to
r >store such GIFs have their priorities backwards? It is costing them
r >less to store it on hard drive than it did for one third of a floppy

Yeah, I wish they wern't so big too... then I could fit a few more of 'em
on disk... Okay I'm guilty :>

APAC is nice, and it will bring the size of a gif to just over 7k but,
for gif viewing... Hay, I did say I use and enjoy all systems....

K >You know whats really scary is that the IBM world just keeps getting bigger.

Hay, you can use Double space or Stacker 3.x and get back about 30% of
your HardDisk... True, I've bad memories of Stacker 2.x...

I guess, to kick my own self in the butt, that if Atari still had a number
of comerical developers supporting and updating there programs, they'd have
to get larger (banked modules) just to be able to add the features everyone
wants... case in point, Zip. One person has said that such a program
would require an expanded machine...320k or better...
Hay, the upgrade's only a hundred bucks, everyone can afford that...then
we'd all be able to zip/unzip when the programs done...

Okay, okay, so this is bleed-over from the last message...it helps me make
my point. Just because something seems cheap (it may not be for some folk),
(look how many collage folks don't subscribe to AC because of the cost...(from
postings here, on GEnie, CIS, IceNet, RIME, and Vnet)).
that doesn't mean people want to waste it.
Sorry Jim, I got a bit off topic...

Mike
too short sighted for his own good

Pretty much... but to keep things in perspective, in 1988, a 1050 sold for about $99 (Toys 'r Us and other outlets)... When the Atari was REALLY big a couple years before that... they sold for nearly $169! (some poor saps bought 'em for $189!!!)

My perspective was not to intentionally look down upon those newer systems. Only to point out that the perception of what constitutes 'a lot of space' sure has changed. People who didn't grow up with the early machines don't have a comparison point to realize how things used to be.

Although, I do have a problem with the current society, and their conditioning that bigger is better. People use these huge MB numbers almost as a bragging point. "See how much stuff you're getting for your money?" Or worse, "See how good it is." I was disgusted to see people's comments in the Amiga newsgroup over a new game called Frontier. It was supposed to be an extensive space exploration and combat game, but when people found out it might only be on one 880K disk, you wouldn't believe how disappointed they were. I heard things like, "Well, obviously this one won't be any good." "This will be a waste of time." "It can't possibly be do very much in that small amount of space." Then someone posted, "It's okay guys, I just found out the program comes out on three disks. It should be great then." Argghhh... The fact is, it did come out on only one disk, is unbelievably extensive with 100's of thousands of light years worth of worlds to explore, and the programmer had to do a lot better work than is normally done these days in order to keep the product to a single disk. I enjoy seeing quality work like this, because all other things being equal, the smaller the better, and the better written it is. Not many people realize this any more.

The points about $$ cost per equivalent storage are partly valid, except that they only mean it isn't imperative anymore to worry about file sizes, like it used to be. It doesn't change the fact that it would still be beneficial. Technology has gotten better and cheaper, and if programs were written the same way as they used to be, all of those advances would be passed on the the end user. Instead, most current generation programmers are using the faster machines and cheaper storage costs as an excuse for getting away with much sloppier programming. Thus, they are wasting much of the advantage that we should have been getting.

I had an old style satellite system that had separate units, (and remotes) for 3 pieces of equipment. It was a real pain to keep track of all of those, so I stuck an 8 bit in the front room, and taught all of the IR remote codes to it. (Like one of those learning remotes). I also did some IR receive stuff with it, so that I could talk to the 8 bit with one of the remotes. From there, I could issue a single function to the computer, and it would in turn send all the codes necessary to the individual units to do what I wanted. It worked pretty neat.

I almost took it one step further, because one of my commercial 8 bit related products is an on screen TV guide. I could have selected a program from the listing, and automatically set the system to the location of the program. Or recorded in on the VCR at the correct time! This was never worth developing commercially, because our TV guide service is non-interactive, only having a single 8 bit at the cable system itself, broadcasting a continuous display of current programming info.

I was just over a friend's place as he was playing Blakestone, another of Apogee's newest releases for the IBM-compatible world, and started thinking... these guys really have the 3-d perspective engine running quite well, with the new release of Doom1.1 and Blakestone and all... hmm, I recall Datasoft and Philip Price kind of pioneering that work back in the heyday of Alternate Reality, Mercenary, Wayout, etc... wonder if ID/Apogee would be interested in a new twist to their shoot-em-all-till-everything's-dead-hahaha-games and try to resurrect not just the old Alternate Reality: The City and Dungeon for the PC, but to actually bring back to life the old FULL idea of the game... 6 main sections starting with the City, branches to the Dungeon, Wilderness, Palace, Arena, and the "final confrontation/escape home". They've released 6-parters before: Keen and Wolfenstein for instance... they could release a WEAK demo of the City version for sharware... they have the 3-d view already working perfectly... some old work WAS already done for the IBM PC versions by Datasoft YEARS ago on the City and the Dungeon...

Anyone know how to contact ANYONE from the defunct Datasoft company? Anyone know Philip Price? Gary Gilbertson did most of the musical composition for the work if I recall correctly. How about good old Gary? I believe I can make a strong sell to the guys at ID/Apogee, in fact, I think I went to school with one of the main programmers a few years back (college). I assume they'd have to get the rights from Philip Price since Datasoft's long gone... he'd be my best contact. Also, he had the entire story-line laid out... specifics, no, but concept, a BIG yes!

Heck even with 320x200 graphics, it would look wonderful... the Atari version used a full 128 color palette, could switch EASILY to 256 color VGA on an IBM compatible... would work even on the old 256k VGA cards! A sound card would be mandatory... well, maybe not. But sounds WERE VERY IMPORTANT to game play, remember trying to triangulate a smithy's banging off hidden corridors? Some sounds announced the amount of "EVIL" in your foe. Other sounds were just entertaining: walking near the arena, you could hear the fighting; by the palace, the "royal serenades"; the lightning and rains out in the open areas of the city. Man, that game had some really nice touches to it! The rising and setting sun, weird multi-color pools after toasting a baby dragon, etc. AS LONG AS THEY KEPT TO THE ORIGINAL GAME CONCEPT, little combat menus, banks, inns, taverns, guilds... wow, what a progressive step for ID/Apogee to make! They have some phenominal shoot-em-up combat games, this would add more of a real-life or thinking aspect in one of their games... it'd throw most of their followers for a loop! I'd pressure all the people I know that had the old 8-bit Atari's to register for an IBM ID/Apogee release of it!!! I'm sure it'd make some profits for them! Heck, Philip Price might even agree to work on it with them!??!??!

ID/Apogee's typical games last 20 minutes to a couple hours start-to-finish, even full-length registered versions. This was more of a several day, 24 hour straight type of venture... you could keep going MUCH longer if you wanted. This game had a couple tricky puzzles, but more of a "building" game... you just don't start out with a mega-powerful character and go through the maze-like streets (sewers for the dungeon) blasting everything you encounter. Had a huge randomness factor I liked too! Some stats kept on your character could be seen, many more were kept as the computer/game monitored your character play and adjusted encounters accordingly... nice touch! I know this might sound more in the line of an established strategy/RPG company such as Origin, SSI, or the like, but with their continued good showing in the 3-d viewport arena and their proven soundcard support in the games, ID/Apogee may be the best place to start my quest! I figure they'd love a chance to expand their field of expertise into a new realm. The City could be a trial run, with the Dungeon being worked on at the time of release... if it goes well and they get a lot of positive feedback (and registrations), I bet they'd go for it! As long as it's not a rush job on the 4 unfinished parts (are they? Philip Price thought a LOT of this out in advance, I wonder...), I'd bet it would make a dent into the big RPG market!

Any leads would be appreciated! I don't know why this urge to see this game played around the globe again has come over me... maybe that's just it. I remember years back when most people in the city were working together to get through the game... Atari, Commodore, Apple, IBM PC and PCjr... weird... maybe I just need more sleep. But I AM serious about trying to acquire some info on the author and the company. Can I make a difference? Can I help bring that time-killer Alternate Reality back from the grave? Who knows! But I'm certainly going to give it one heck of a try!!!!!

-Tim
(timuszyn@jupiter.cse.utoledo.edu)

PS: I have the following outdated info already:
Datasoft (also IntelliCreations, Inc.)
19808 Nordhoff Place
Chatsworth, CA 91311-9969
(818-886-5922)
Author: Philip Price, Music: Gary Gilbertson
(work by Paradise Programming, Inc.)
Guidebook: Kathi B. Tremblay

Also, the Dungeon weilds a load of names:
Programmed by: Dan Pinal, Ken Jordan, Jim Ratcliff, Rick Mirsky
Original concept by: Philip Price
Music composed by: Gary Gilbertson
Graphical art by: Benita Long-Hemsath, Steve Hofmann

(for all the good it'll do me)

>

This touches on one of the components of application growth ... everyone wants to add every feautre avaialable in every competing program. Even the concept of a word processor .. originally one did text editing, and then fed the result to a text processor for formatting and printing or viewing. Then someone though .. hey with a nifty display I can try to show what the output might look like on the screen ... and with this graphics display .. make it look exactly like the printout .. and lets merge some gifs with the text .. just like a publisher would! Wow!

And of course all these added modules take space ... and the interactions between modules take more space .. and the fact that one moved from assembly code to compiled higher level code in order to manage the increased complexity ... and then moved again to a higher level language .... and so it goes .. each step of abstraction could easily double the size of the resulting code.

Trouble is .. someone can afford it ... and so it sells. And efficency without the bells and whistles doesn't .. at least not sell as widely or as profitably.

>

And the thing is ... sloppy programming techniques don't need to be
that hard to overcome the trade offs are reasonabbly well understood.
I think part of the problem may be that people learn programming, in
general, on a college campus on a large mainframe/mini/workstation/network
environment and unless they end up in a controller oriented job, have
little incentive to optimize code, or learn to structure things inherently
efficently.

And every trend towards programmer efficency leads directly to space
inefficency (though not necessarily too much performance inefficency,
other than the IO bandwidth constraints, as optimizing compilers can
be very smart). Reminds me of driving the car to the corner store ...
pretty soon our kids will be driving the 747 to the corner store ...
and not even know that they could walk there in 5 minutes, less time
than it take to warm the engines.

Sorry not to jump in sooner...I've been out on vacation. You got most of them right, but DEGASRD only views Atari ST Degas pics (.PI1/2/3 and .PC1/2/3) in ColrView format. JView XL is in beta test and doing nicely. The first release will only work with MyDOS (and probably DOS 2.0/2.5) since it must use the RAM under the OS that some versions of Sparta depend on. But it will decode direct from GIF to ColrView at much the same speed that APACVIEW decodes to APAC mode.

Send requests/questions to my GEnie address below...

I seem to remember .. (gee, the soft state memory gets dim) that when i
bought my 400 for $299 or so, the 850 disk drive was about the same price.
I talked myself into affording the 400 as a graphics peripheral for my
6800 system ....

gee .. a color graphics board is $200, for only a little
more I can get this, and play games with it as well! ... all I have to
do is tie the two together ... of course, the 400 took on a life of its
own as a second computer, especially after expanding its memory.
aIt was, after all, the only computer I had that was usable while listening
to short wave radio .. if Apple hadn't had the political clout to
have the FCC relax the specs, the Apple versus Atari battle would
have been completely different.
>

What I should do now is tie an SS-30 bus from the 6800 systems to the
PBI bus of the Atari 800XL ... 8 expansion slots ... video digitizer ..
floppy controller ...D/A and A/D converters ... hmmmmm.

Source record: 103609

I'm glad to see my message got out. I was thinking this newsgroup was read only (a Pcboard setup going through .ca.canrem.com).

As far as vanguard goes I think that it could have been a 5200 port. I've heard that somebody was doing this with a number of 5200 games in the mid '80's. I saw it available rarely in a few dealers and was fortunate to pick up a 2600 version. Definately one of my favorite games from the early '80's. Now, if atari'd done me the favor of porting tempest to the 8bit I'd be walking on the ceiling.

Try $249 (and it came with the ill-fated DOS 3.0). It's still plugging
away, though.

:> available to them at what seems to be the acceptable price tags of $500
:> to $1500 or so?

I think that there's an unnecessary apples vs. oranges aspect to this thread.
I work on PC's using Operating Systems which range from 2 megs (DOS 5.0) to
over 30 megs for the full package (OS/2 2.1 and Windoze NT). I also work
on AIX (RISC/6000) systems where the operating system and information system
alone can easily exceed 200 megs (AIX 3.2.5 + InfoExplorer). I can tell
you first and foremost, however, that I much prefer to hack on my old Atari
800 and 800XL (both unexpanded, with some Happy and unHappy drives).

However, to be fair, the AIX box (a 64-bit RISC processor with a 128-bit bus)
can run huge circles around the PC and the Atari, in sheer power, yes, but
also because it has a full multitasking, multiuser operating system. I can
run huge processes in the background with a few keystrokes and create
three-dimensional solid object models to beat God. But I pay the price in
size and storage capacity. It's that simple. These O.S.'s, as well as
their corresponding applications have a complexity not possible or necessary
on the Atari. It doesn't make them inherently better or worse - they were
created with different objectives in mind.

I think that what really makes Atari stand out in the crowd is the charm
of their products and the style, which is something no other manufacturer
will ever match.

If there is one thing in the PC world that bugs me, that is it. Have you ever seen a book or even a magazine article on "How to code tightly on x86 architecture" ? You probably won't. The Atari programmers knew they had very tight practical contraints on the memory and CPU time their code could use... PC'ers generally don't. The upgrades, of memory, disk space, and even motherboards, are so cheap and quick that the cart really does lead the horse. The hardware industry has been fueled incredibly by the relentless expansion of software, even the games! How many times have you heard an Atarian say "Oh heck, I wanna play Alternate Reality faster, I think I'll go get a Black Box and a 2-meg upgrade...". However, I've watched my friends swap out Sound cards, Hard drives, controllers, video cards, motherboards, 256K/1Mb/4Mb SIMMs, and even CD-ROM drives on a regular basis because it was so cheap, and so necessary to keep up with the advances. Think how much power you could squeeze out of modern 32-bit, 50 and 66MHz processors (and sundry support chips) if the PC programmers wrote as tightly and efficiently as the Atari developers have to...

Food for thought.

>possibility.

I'm planning to use 8bits in my own HA system, although in a somewhat different capacity than you plan; mine will have them as I/O terminals scattered throughout the house - an IR receiver plugs into one joystick port, the A/V (baseband or RF) output runs to a nearby TV for use as a display device, and everything is linked together via RS-485 multidrop serial TP wiring. I'm working on a design for an SIO-to-RS-485 interface which would appear to the Atari as a more or less standard R: device (with appropriate driver software); a couple chips, some resistors, and an SIO connector should be all it takes. If I can only get around to actually doing it...

In any case, an SIO-to-RS-485 interface may be just the ticket for you.

Does anyone remember a little gadget called the R-Verter? Back in the mid 80s when 850 interfaces sold for over $100, these little buggers could be had at retail for less than half that, and although they were a bit kludgy (e.g. it didn't generate true RS-232 signal levels) they did the job. The R-Verter came with software, R: handlers, and complete schematics (even PCB tracings!) By substituting an RS-485 driver chip the same basic design and software can probably be used to connect an 8bit to an RS-485 net for a few $. If there's interest, I can perhaps whip up a schematic in a suitable format (.GIF picture, perhaps?) of something which might work. Input from those more hardware-literate than I would definitely be appreciated; I'm a software type, so my knowledge of hardware design principles is severely limited.

Interested parties, please email me.

This sounds like a great idea. IMHO, Alternate Reality was the bes
game ever made for the Atari, by far. The sheer complexity of it, the
attention to every minor detail, it was unlike anything else made at the
time. Best of all, it fully exploited the graphics and sound capabilities
of the Atari. I couldn't understand why they didn't continue the series;
Didn't it sell very well? I'd be very interested in any future work on this.

Sorry to hear that! I nearly bought another when they dropped to $99. Came with DOS 2.5 by that time also... argh! Great to hear it's still working! I FINALLY had the 810 blow on me I received back in 1982 or so... cost about $368 at the time! Now, you want to talk about getting ripped off! Ouch! It sold in other computer stores in a couple months for about $270... man was I mad!

Remember when 800xl's ran somewhere around $79-$119 new also?

Atari 2600/7800 cartridges FOR SALE:
(All cartridges are BRAND NEW in factory boxes w/manuals unless otherwise noted. Multiple quantities available unless indicated with a (1).)

2600 Video Game Cartridges-

$1 EACH titles:

Crystal Castles *No manual* (1)

$2 EACH titles:

Asteroids, Circus Atari (1), Crystal Castles (1), Ms. Pac Man, Missile Command (1), Pole Position (1), Realsports Football, Solaris, Space Invaders, Venture (1)

7800 Video Game Cartridges-

$1.25 EACH titles:

Dark Chambers *Used w/manual and box* (1)
Dark Chambers *No manual or box* (1)
Karateka *No manual or box* (1)

$2.50 EACH titles:

Asteroids, Ballblazer, Choplifter!, Crack'ed (1), Crossbow, Dark Chambers, Dig Dug (1), Donkey Kong (1), Food Fight, Hat Trick, Jinks, Joust, Karateka, One-On-One Basketball, Pole Position II, Realsports Baseball (1), Robotron:2084, Xevious

If interested in any of these cartridges, contact Lawrence Estep by CompuServe Mail at 71450,1050 or Internet at 71450.1050@COMPUSERVE.COM.

Prices include shipping & handling. All orders will be shipped via USPS. This list was updated on 12/28/93.

You can edit .newsrc with a text editor such as emacs (don't use fse
if you have it; I hear it does nasty things to .newsrc).
Delete all the lines for groups you don't read and never will.

> Could anyone please offer me some advice? Should I have --SEVERAL--
>startup files and use a shell script to move the "domain" I want into a
>".newsrc" file and use ".newsrc" as a temporary working file instead of
>keeping it as a permanent file? Is a shell script hack the wrong approach
>to take? Is there some obscure "builtin" command in RN that aids the user

Somebody at Ohio State wrote a PERL script called newsclean to pare
down .newsrc; it can either delete all the message numbers from
unsubscribed newsgroups or delete all the unsubscribed newsgroups.
I use it in my .logout to chop my .newsrc after every session.
For more info about that, send mail to
consult@magnus.acs.ohio-state.edu.
I don't know if they'll help or not, but they do have the knowledge to
help.

The original FCC specs for home use were very tight, I don't recall
any of the numbers, but the Atari 400 and 800 were on the drawing
board while the specs were being proposed. Hence the cast metal cases
around everything. Hence the series resistors and bypass capacitors
on every line going in or out of the metal case.

The Apple II had already been around a while, and would have required
complete redesign to meet the specs. After Apple (and probably one
or two other computer companies) complained it would to be impossible
for them to meet the specs (sure .. and here the Atari 800 met the specs
as written), they were relaxed.

By the way, for those of you who suscribe to Atari Classics. In my
opinion, the reason for the capacitor rolloff of the video signals
discussed in the video mod articles was to meet these FCC specs, though
I could be convinced that they were there to help the display fit
into the RF channel for the modulator.

4778. Power supply for 1200XL

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-28 17:34:41 UTC
From: gbennett@friendly.sim.es.com
Message-ID: <2fpqnh$5s0@cnn.sim.es.com>
Source record: 103739

Hey fellow 8-bitters,
I recently acquired an Atari 1200XL (sans power supply). The
power supply connect appears to be the same as the 800 and 400.

Q: Can I use my 800/400 9vac power supply for the 1200? Or does
it use a different voltage?

I checked the FAQ and it said that all but the the 800/400 use the
din power supply connector.

Thanks in advance,
Greg Bennett

I remember going into Computer Land with my mother and watching her plunk down $1500 for my first 800 and 810 combo. I went back for a printer a month later, don't remember how much I spent on that though.

I think that was back in 1980 or so, sheesh. Those were the days, the thing still works though, I've gone through three power supplies of course, but I think anyone will an 800 this old will have a few fizzled power supplies.

Ok, ok...its probably already been posted but C.C.S. (Bob Puff) bought
ICDs 8 bit line now and all you leaches from Polland are breaking
the copyright law (or whoever is making and selling pirated x carts)
Bob plans on selling the R-time8 and and OSS/ICD carts around March 93.
R-time8 is going for 49.95.. He's also selling something called the
R:P: (not PR) Interface that goes up to 38.4k for 9600 and 14.4 baud
modems--selling for 59.95.
Oh well I guess you all know by now.

Wrong! The BEST way to get 80 column is the buy an XEP80 interface AND
have a split chroma/luma monitor for the 40 col. resolution.

That's what I've got.. An XEP80 AND a Commodore 1702 - but
I use the XEP80 on a SAKATA SG-1000 mono-chrome monitor for PERFECT
80 col. resolution.

I really wish more people would write efficiently and with bells and whistles, if for no other reason, to prove it can be done (without having to bring up examples from the early 80's).

To say the least, the Black Box is flaky. When you buy one, there is a darned good chance that it: 1) won't work from the on-set at all; 2) will work, but not correctly; 3) will work for a while, then work unreliably; and 4) won't be compatable with your computer.

Bob Puff basicly has a no-questions asked, unlimited 100% complete repare/replacement policy for the Black Box (Gee, I wonder why?).

Actually, to be fair...Bob is hand assembling this stuff basicly by himself. Tough job. Really no way he can check everything completely.

Things can be done to make it work. Send it back to Bob, or if it's the Computer, send it to Bob. He's get it working for you (Computers do cost to repair thou. Also, if you got a known good 97antic in anything you send I'd suggest sawpping it out with an old 96 if you have one. 97's are like gold now adays, so you better hang on to what you have.)

Interference. Yup. That sums up Atari nicely. Both giving and recieving. You throw in a non-shielded BB, maybe you did upgrades to the computer and left the RF shield out (like I did when I did the Stereo, 512K and US+/OS in my 800xl), you'll get some RF. It's not as bad a Commodore thou (even with an RF shield. My C-128 with Stereo upgrade can cause interference on the Cable TV!)

Speaking purely from heresay, and not from actual hands on experience,
I suspect (from a PC world point of view) that GEOS is what Windows
would be if it was written efficently .. much smaller, much quicker,
runnning well on machines with much less in the way of resources.

But I've never used it ... nor do I use Windows except for a few
Windows applications that I toy with, and to learn enough to help
people out with problems. I guess I am just a keyboard kinda guy,
all this mouse/graphics stuff is for the birds <grin>. It'll never
last!! <big grin>

Not me, but I came close to paying $400 for a 400! Bought one for
something in the low $300s right after they dropped the price, as
I recall.

My boss, however, I think did pay big bucks for an 810.

>if Apple hadn't had the political clout to have the FCC relax the specs,
>the Apple versus Atari battle would have been completely different.

Boy, I had almost forgotten about this. One of the other reasons I disliked the Apple II system at the time.

Another was because I had a roommate with an Apple II, and everytime he turned it on my screen display was full of trash. This was before I got a monitor.

One more piece of info that I can recall about this, was that at one point it became clear that when these FCC specs went into effect, the Apple II was going to have to be pulled off the market. I remember them trying to shield everything, to no avail, there was quite a bit of buzzing around On-Line Systems at the time, wondering what was going to happen to the machine. I of course, was somewhat pleased that the machine was going to disappear for awhile. :-) Ok, I was just a kid. Anyway, I remember it getting very close to the wire when the FCC changed the specs. There was never any question in my mind that Apple convinced the FCC somehow to relax the specs.

I'm sure Atari was really pissed, after spending all the effort and money to create a really clean machine. I wonder if Atari would have used a parallel access floppy drive if it weren't for the FCC specs. Those 'antennas' on the Apple II were probably the worst offender.

Of course, even if the specs hadn't been changed back then, something would have had to be done well before now, because today's machines with much higher clock speeds could never pass the specs the 800 had to endure. Does anyone know whether the specs were ever relaxed even further between now and then?

>and then?
>

Ummm ... sorta relaxed .. in a user sorta way. Remember there are two
specs .. a class A spec for office use only, and a class B, tighter, spec
for home or office use. Most of the PCs being sold only meet the class A
spec, and should never be used in the home (at least according to the FCC).
I suspect that the only equipment really meeting the class B spec are video
games.

I do not know whether the details of class A or class B have changed since
the initial release of the specs, however. But effectively, if people
are using class A equipment in the home, the specs have been relaxed.
Although, if you are a victim of RF interference from class A equipment
in the home from a neighbor, you are going to be able to cause someone
some very expensive modifications to eliminate the interference.

4794. Re: Even more stuff for sale

Newsgroup: comp.sys.atari.8bit
Date: 1993-12-30 00:45:17 UTC
From: Ordania-DM@cup.portal.com
Message-ID: <99514@cup.portal.com>
Source record: 103752

Updated 12-28-93 (some stuff sold, some stuff about to be sold, and more stuff added)

BIG NOTE: The prices listed below are automatic-sale prices, if you offer that price, I'll sell you the item. The prices are close to list price in many cases, mainly because I haven't been 'in' the Atari scene for several years. Feel free to make any offer on anything I won't be nasty if I don't like it, I'll just say no. And who knows, if the item doesn't sell, I may send you mail and accept your offer. However, some items have a value beyond what they originally sold for - notably the ICD items, some of the books, and upgraded items. These special items will not be sold cheaply, though you might be able to buy them from me for less than what is listed below.

Here's a bunch of stuff for all you Atari-8-bit-die-hards...

All the following items are for instant sale at the listed prices, however, feel free to make an offer, I'm trying to get rid of this stuff without throwing it out. I also have other items including a lot of magazines, and paperwork (schematics, upgrades texts, etc); if you're interested in these, let me know.

Price Hardware Item
150 Magnavox RGB Display 80 Monitor
100 XEP 80 Column Interface
100 XDM121 Atari Daisy Wheel Printer (direct connect - uses SIO cables)
100 Panasonic KXP 1091i Printer (parallel printer interface)

100 Indus GT Disk Drive with Write Protect Modification
100 XF551 Disk Drive with 3.5" switchable EPROM. (with addition of 3.5" mechanism, you can use 3.5" diskettes at the flick of switch)
85 XF551 Disk Drive
65 1050 Disk Drive

70 Atari 800xl
50 Atari 800 (Axlon 32k ramboard, 65C02 CPU)
40 Atari 800 (48k)
30 Atari 800 (Rev 1, no right cart slot)
20 Atari 1200 Motherboards (4, price is for 1)
15 Atari 400 (2, price is for 1)

25 Seikosha Printer (Atari direct connect)
25 Sega Light Gun with Atari Cable Converter (home made, works great)
15 CX85 Keypad
15 CX22 Trackball (2, price is for 1)
15 Voice Box

10 XM301 Modem
10 1030 Modem
5 1010 Cass. Drive
5 410 Cass. Drive

Cassette Software Item
10 Tanktics

Disk Software Item
20 Mail Order Monsters
20 Ghostbusters
20 Seven Cities of Gold
20 Ultima II (no cloth map)
20 Spy vs Spy I & II
15 Archon
10 Murder on the Zinderneuf

Not too well if any wiring is connected to it, ie joysticks or power supply
or monitor lead. If not hooked up though .. hmmmm ... just a few inches
of wiring for the keyboard and the various jacks ..... most of the lines with
series resistors and bypass caps .... hmmmm ...

Hello, all...

As I type this, I am on the phone with a friend, and we've just resurrected the memory of a software product whose current status we would like to know. We're looking at a boot disk of "Diskey" -- short for "Diskette Access And Repair Key" -- by a fellow named Sparky Starks. The boot says "copyright 1982 by Adventure International." Reading through various sectors on the same boot disk, Sparky personally promises several additional products -- "Starcruiser Atari," "Printer Fix" -- which, as far as either of US know, NEVER appeared.

Does anyone know what ever became of Sparky Starks, "Diskey," and/or Adventure International? Does anyone know the preferred legal status of "Diskey" at this late date (a friend wants a copy)? Did any of the sub-sequent products ever come out? What's THEIR status/availability?

Chris

joseph sabatino (ab588@yfn.ysu.edu) wrote:
: Ok, ok...its probably already been posted but C.C.S. (Bob Puff) bought
: ICDs 8 bit line now and all you leaches from Polland are breaking
: the copyright law (or whoever is making and selling pirated x carts)
: Bob plans on selling the R-time8 and and OSS/ICD carts around March 93.
: R-time8 is going for 49.95.. He's also selling something called the
: R:P: (not PR) Interface that goes up to 38.4k for 9600 and 14.4 baud
: modems--selling for 59.95.
: Oh well I guess you all know by now.

Yes, yes, we DO know about this... you're almost correct though...
and easy on the leech thing accusation... sheesh, like you're all fine and
moral! At least someone was TRYING to keep that product in distribution.
Too bad they didn't contact ICD, they might've sold the rights for a couple
bucks then the cart really would've been legit. Hard to contact defunct
companies out of the country though, wouldn't you think?

C.S.S. is a partner with another company "Fine Tuned Engineering" in the
transfer. The last I heard C.S.S. will be producing SOME of the hardware
products that ICD used to carry, and F.T.E. will be producing a COUPLE of
ICD's cartridges. This did not include SpartaDos. Whether or not Sparta
ever again sees the light of day is probably up to you. Anyone interested
in buying legit copies of SpartaDos, the best thing I can tell you is to
try and contact this new distribution company, Fine Tuned Engineering...
it sounds as if they'll be reproducing software other firms created long
ago and have since gone "belly up". I don't have any more info on that
company to help you though, sorry. Maybe C.S.S. can provide the details if
you call them up???

(Four DEFINITE products FTE has announced are Basic XL, Basic XE, MAC/65,
and Action! To support SpartaDos is a major undertaking, you're going to
have to PROVE to them that enough users are out there who will financially
support that DOS!)

(Side note: Bob and another unnamed party are working these days for a
forthcoming version of MY-DOS! Should allow for the max drive size to go
as high as 48 or 64 Meg as opposed to the current 16 Meg limit... (partition
size that is!) Hopefully fixing any other floating bugs as well!!! If you
any MY-DOS BUGS to report, PLEASE post them or write/call Bob. If we get a
few bugs posted, maybe one of us can compile a list of them and let Bob know
before the release! I know of only a couple, but never experience them since
I lack a hard drive!)

I've got in front of me the most recent issue of _PC Techniques_, a IBM
programmer's magazine. In it is an article on code optimization techinques
at the assembly level for the 386 and 486 using the cellular automata
Life as an example. What is most surprising is that the best techniques
didn't just optimize the code but also rearranged the whole data structures
to make things efficient. While not all PC programmers are optimization
freaks, the best programs are profiled so that the parts executed the most
are given the most attention.

Source record: 103608

Well, I wasn't really planning on how to work the sound emulation. :0.
I was planning to tackle that last.. Way last.

Help with the RS600 port would be cool. I'm going to try to put the
machine dependant code in one place. This would be keyboard access,
screen writes, and sound...

EMulating the sound is a nightmare.. Some programs used the interference
between voices to make nice effects. I am beginning t o think that will
be IMPOSSIBLE to emulate.

Which is part of the problem .. I would tend to take the same approach,
these days, and all that does is optimize a program for speed. It does
nothing for the size crunch problem, as it only examines the 10 percent
of a program where it spends 90 percent of its time.

WHich is the problem .. there is little incentive to optimize for size.
Some incentive to optimize for speed, as that will make your product
snappier in comparason to others.

Subject: Typos In The December AC

[ATTN: AC Staff, please post to all nets & BBS's! -BP]

A few minor typographic errors in the hardware construction projects presented
in the December issue of ATARI CLASSICS have been brought to my attention. A
full errata will be published in the forthcoming February issue now in
production. The errors are minor in nature & should not seriously affect
anyone's ability to perform the video upgrade modifications. The typos
appeared in "Super Video 2.1XL" & in "Super Video For The 130XE", as follows:

1.) Page 9, Step 3: the text should read R52, not R53.
2.) Page 23, Step 5: the text should read Q2, not Q3.

With such an enormous amount of technical detail presented in one issue, I
suppose it was inevitable a few bloopers would sneak in. I will be most
grateful if anyone out there finds additional errors, please report them to me
so we can get the info out to the community as fast as possible.

Please note that, due to a large shortfall in subscription renewals, I was
forced to order a cutback in our December press run.
The special video issue is now in short supply & will not be included in
subscription renewals that failed to reach my hands as of Dec. 5, 1993.

Further, due to the extra length of the special December issue, the price
for a back issue of the December AC has been raised to $5.00 postpaid.

Finally, i regert to announce that beginning in 1994 ALL back issues of AC will
be priced at $5.00 each for mag or disk, inside or outside the USA. It would
appear a number of individuals have taken adfvantage of the former low $3 price
for back issues & have not subscribed but only bought individual back issues at

the low price, thereby saving money over the normal $25 subscription price. I suppose I could have tolerated this, but at least one of these people went bragging about it to his friends & made them feel like chumps for paying the full subscription price. I guess this riled me a little. With the increase in back issue prices it will now be cheaper to subscribe than to just buy back issues. Sorry, folks, as usual the many suffer for the sins of a few.

>porting tempest to the 8bit I'd be walking on the ceiling.

Yup- I have a copy of xevious hanging around somewhere. I recall
reading some statement somewhere from an Atari corporation rep.
that it was ok to copy and pass around ports of 5200 games. Can
anyone confirm this?

Now, I think there is a PD or magazine version of tempest that I wasn't
really terribly impressed with... it may even be on the archive.
I don't remember the name, but I do remember it was written by one
of the PD/magazine heaviweights- I'm thinking Tom Hudson or James
Hague for some reason.

Now, Xevious in the arcade was (and is) one of my favorite games but the
port of it to the 8-bit had one major flaw- it needed two buttons. I
don't remember how the guy who ported it solved this problem- whether
the bombs just fell every so often or the bombs and missiles were
syncronised, but I do remember it was pretty unsatisdactory and became
a real problem as you got even moderately into the game.

I have a couple of 5200 motherboards salvaged from thrift store 5200s that
were without controllers or power supplies. They do not have a PIA so I
imagine all the joystick input was through the POKEY. I have thought for
a while that it would be interesting to use the extra POKEY provided by
the GUMBY upgrade to hook up 5200 controllers (or homemade facsimiles)
to the 8-bit. Anybody have docs on the 5200 controllers? I know I
saw a file here years ago on how 5200 ports were done... (The reason an
extra POKEY would be necessary would be to connnect the keypad)

Brent

Let me qualify my above statement. It has more to do with the business of developing PC software than with actual ill or good intent/competence of the programmers involved. In the highly competetive and fast-moving PC software market, software is usually (this comes from verified experience with, for instance, Fifth Generation Systems - now Norton/Symantec FGS) shoved out the door to meet critical marketing points regardless of the actual completeness or stability of the product. There is essentially NO time or thought or effort expended towards code optimization except between revisions, at which time the performance itself is set forward as the major goal of the revision in some cases. Usually, however, the primary goal is addition of catchy features. A notable exception to this mentality is ID Software (who were or are somewhat related to Apogee Software - I've lost track :), who have made some truly revolutionary advances in the state of gaming performance, technology, and feel. (i.e. They've rolled back the clock 10 years and made software that plays like Atari 8-bit/ST games, only with more A/V resources to take advantage of...)

Back to the main point: To quote the director of development for a rather large PC software firm who shall remain nameless, "Speed and size of code is the compiler's job" in the PC world. <sigh>

I don't think trying to convince the company that there are enough people out here that use SpartaDOS is going to be all that hard. Ther are appx. 400 PRO sysops for one that are still active and have boards up and running. If we have to give up our active boards for another dos, forget it!! Besides, that, there are many loyal SpartaDOS users that don't run any kind of bbs that use and like SpartaDOS, and will support it. I've read alot of different things about SpartaDOS and what it has done to some user's system. I guess I'm one of the lucky ones that hasn't experienced any of these things. I have been using SpartaDOS/X since 1987, and have not had any of the problems mentioned in these posts. I'm not saying that I haven't had computer problems, but I tracked it to OLD hard drives, and brownouts/blackouts and nothing more, but then again, I always double check my keypresses before hitting the return key.

: BIG NOTE: The prices listed below are automatic-sale prices, if you offer
: that price, I'll sell you the item. The prices are close to list price in
: many cases, mainly because I haven't been 'in' the Atari scene for several
: years. Feel free to make any offer on anything I won't be nasty if I don't
: like it, I'll just say no. And who knows, if the item doesn't sell, I may
: send you mail and accept your offer. However, some items have a value
: beyond what they originally sold for - notably the ICD items, some of the
: books, and upgraded items. These special items will not be sold cheaply,
: though you might be able to buy them from me for less than what is listed
: below.

Wow, nice comeback... sorry about my earlier msg. The prices were a bit high, though. It was just that many of the items on your list sold near the same price (some actually lower) in the heyday of Atari years back. Now-a-days, quite a few things have sold on this group for half your list price. I understand you'd like to get the most for your old Atari equipment, I know I sure would. As long as people know this is your "first asking price", which is generally higher than anyone would like to spend before haggling a bit on the price, sounds like a fair idea to me!

Good luck on the sales...
Happy New Year! (in a good mood tonight)

Just had a question pop up to me in email on the Black Box... whoa... keep forgetting not many news group readers watch all the groups they're subscribed to every week. Thanks for the reminder Mike... even though you probably didn't mean for it to be!

I've been asking various questions on the Black Box (available from C.S.S. in NY, U.S.A.) in this group since around October. I was REALLY in the dark as to the quality of this unit, and wondered how well it worked out for everyone who bought one... for the most part, reviews are quite good! Recently, I myself decided to join the ranks of the Black Box w/Floppy Board owners. Ouch, big mistake for me. A couple msgs I posted last week made a couple brief comments that I was encountering a few frustrating problems. Since I did not "elaborate" much, a couple users were curious... I thank all who asked. It turns out there are a few known problems/irks with the 'box. If you're the "average" Atari user, which now-a-days amounts to being a bit of a systems hacker, you'll love the box. Me, I've done a bit more tinkering, plus I've got a couple old peripherals that aren't all that umm, standard. One name: ASTRA. I've got one, more specifically, "The One" - a 360k drive with printer interface built in. It has some VERY handy features which aren't too well known. I could run up to 3 additional 5.25" drives, 3.5", 8", 3" (remember good old Amdek's 3 inch drives!?!), or any combination thereof. A few SPECIAL feautures include: forcing you to hook this drive up as D1:... if not, certain things won't work correctly - I won't get into this. Ignores the P:R: connection... or any other printer interface. Well, not quite ignore... more like "generally-ignores" with spurts of random problems during long print sessions. Argh... this is getting longer than I had expected, have to cut this short.

Another hardware problem, the PBI port on my 800xl seems to disagree with the 'box. I've experienced some SEVERE display interference! Readable? Sure, but barely. Would give ANYONE a healthy case of eyestrain trying to use this system. I've tried switching my RF cable around, changing channels 3-2-3, limited shielding, etc. to no avail. I've talked to Bob, and all he could tell me is that it was "common if you are using a television as your display". The fixes he mentioned I tried, and are described above... your best bet is to buy a monitor!

Next, drive "burping". This is a "feature" of the 'box I could do without. If you have a hard drive attached, this is nearly instant so you might not even notice. It checks the

drive several times for defaults/configs or just to see if the drive is still active or SOMETHING like that... just slows down my access an extra couple seconds when rebooting, going to DOS when using my faithful 'ole BASIC installed on the system, etc.

The Black Box plastic case... just one word, one contraction: DON'T
(It's not that it's that poorly made, or... well, let me just say Bob at C.S.S. does NOT make it - he sends out to another company for them... costs him about $35 for it! Not buying it really won't hurt his sales/profits and will save you trouble! SUCH AS: the power cord clip that you insert into the 'box doesn't fit if you have the case on. You physically have to bend the connector pins! The circuit board with or without the floppy board attached really doesn't fit in the case. I can see some ends of the case bending "just enough" to encompass the poor thing.

Originally, I was against the cabling idea - you know, having to buy all new printer and modem cables to use with the 'box. BUT: they are quite easy to make or replace if need be! The floppy drive connector is a STANDARD IBM-type edge connector. Won't cost you that much to make! It's even better for the hard drive - the connector's identical to the socket most controller cards use on the IBM! The only thing here is that you will most likely have to make it yourself... most existing cables (if you plan on canabalizing an old IBM-type system) are far too short unless you plan on placing your hard drive right behind your 'box.

Soooo...

If you are considering purchasing the Black Box,
and you are going to use a hard drive immediately,
and you have or plan to buy at the time a monitor,
and you do not have a smart drive (such as an ASTRA),
I will venture to say you would be QUITE happy in purchasing the Black Box w/Floppy Board! (I'd recommend the Floppy Board, it's not that much more, and I'm sure you'll want to hook up a 3.5" drive for quick swapping of files to an IBM-format or just as a "mini hard drive". Sun Sparc's, Mac's, Atari, Amiga, ST, and of course IBM read files stored in an IBM-format rather well.

If you do not have a monitor... I've had one good report of a user successfully using the 'box and a TV. Although he went through about 6 computers to find one with the least distortion. Radio Shack also has some device which will eliminate SOME of fuzzy-effect... not sure what it's called.

If you have a smart drive... ASTRA's one brand... forget what the other one was... argh... I knew someone here in town who ran a few quad 5 1/4" off it, TRUE quad 5 1/4"'s that is (720k)!!!

It will work, just have patience. Keep configuring away, you'll find a setup that's livable.

For me, the big issue was interference. On my system, it was beyond "how BAD is it?". It was more like, "WOW - HOW CAN YOU READ TEXT!?!" The other quirks wouldn't have bothered me much in the long run. The reason I returned it: simple system incompitibility - I don't have the money to drop on a new monitor and hard drive at the moment.

Soooo... (take two)

For a new printer/modem interface that does A LOT MORE...
For a HD controller with a few EXTRAS...
For a card allowing you to connect a few MODERN slave drives (floppy) to your system with minimal effort...

The Black Box is a fine piece of engineering!

sleepy time all...
Happy New Year!!
-Tim...ZZZzzzzz

4815. MyDOS-Bug

Newsgroup: comp.sys.atari.8bit

Hi there!

In the 'SpartaDOS-X'-article someone wanted to know the known bugs
from MyDOS. I mentioned it before but I found a very nasty one when
using subdirectories (I use MyDOS 4.50). Sometimes it happened that
two different files used the same sectors!

Not much, but better than nothing...
Jochen

: Does anyone remember a little gadget called the R-Verter? Back in the
: mid 80s when 850 interfaces sold for over $100, these little buggers

Not only do I remember them, but I have one! That is probably what I will be using for my TW523 -> Atari interface. Unfortunately, the company went belly-up (I think) shortly after I bought the gadget. I tried calling their number once, and got a Wal Mart! (sigh).

By the way: I once wrote a clock program for the Atari that didn't suffer from slowdown due to disk I/O. As soon as I can get everything dusted off, if anyone is interested, I will post the details.

I had a fair amount of interference on my commodore color monitor- when I first got my BB I had the monitor hooked up to the composite output of my XL to play some game or another that used artifacting. When I went back to split video the problems vanished. Strange.

Brent

I don't think this is really bashing the big boys anymore then they bash themselves. They had the annual "West Coast vs East Coast" computer trivia contest & when Bill Gates posed the question, "There is a contest on Internet to write the most obsc, arcane
progam in C that still actually does something. Nae that contest!" Philipe Gasse <sp?> responded "Microsoft Windows!"

4819. Re: Even more stuff for sale

Updated 12-31-93 (some stuff sold, some stuff about to be sold, and more stuff added)

BIG NOTE: The prices listed below are automatic-sale prices, if you offer that price, I'll sell you the item. The prices are close to list price in many cases, mainly because I haven't been 'in' the Atari scene for several years. Feel free to make any offer on anything I won't be nasty if I don't like it, I'll just say no. And who knows, if the item doesn't sell, I may send you mail and accept your offer. However, some items have a value beyond what they originally sold for - notably the ICD items, some of the books, and upgraded items. These special items will not be sold cheaply, though you might be able to buy them from me for less than what is listed below.

Price Hardware Item
150 Magnavox RGB Display 80 Monitor
100 XEP 80 Column Interface

100 Panasonic KXP 1091i Printer (parallel printer interface)
100 XDM121 Atari Daisy Wheel Printer (direct connect - uses SIO cables)
25 Seikosha Printer (Atari direct connect)

100 Indus GT Disk Drive with Write Protect Modification
100 XF551 Disk Drive with 3.5" switchable EPROM. (with addition of 3.5" mechanism, you can use 3.5" diskettes at the flick of switch)
85 XF551 Disk Drive
65 1050 Disk Drive

70 Atari 800xl
50 Atari 800 (Axlon 32k ramboard, 65C02 CPU)
40 Atari 800 (48k)
30 Atari 800 (Rev 1, no right cart slot)
20 Atari 1200 Motherboards (4, price is for 1)
15 Atari 400 (2, price is for 1)

25 Sega Light Gun with Atari Cable Converter (home made, works great)
15 CX85 Keypad
15 CX22 Trackball (2, price is for 1)
15 Voice Box (photocopied docs & software)
10 XM301 Modem
10 1030 Modem
5 1010 Cass. Drive
5 410 Cass. Drive

Cassette Software Item
10 Tanktics

Disk Software Item
20 Mail Order Monsters
20 Ghostbusters
20 Seven Cities of Gold
20 Ultima II (no cloth map)
20 Spy vs Spy I & II
15 Archon
10 Murder on the Zinderneuf
10 Antic Mapware
10 Antic Rambrandt
10 Visicalc
10 File Manager+
5 Lepus Revenge
5 Superman the Game
5 Timeworks Data Manager
5 Timeworks Electronic Checkbook
5 Timeworks Money Manager

Cartridge Software Item
40 SpartaDOS X 4.20
25 Rtime8 (needs new battery, has battery holder,
battery not SOLDERED in!)

Following Cartridges have no documentation unless specified
20 Action
20 Basic XL (photocopied docs)
10 Atari Assembler/Editor
5 Atari Basic (4, price is for 1, docs not included)

20 Ace of Aces (docs & box)
20 Ms. Pacman
20 Star Raiders (docs & box)
20 Miner 2049er
15 Adventure Creator (docs & box)
15 Defender
15 Qbert
15 Return of the Jedi
15 Donkey Kong
10 Pacman
10 Asteroids
10 Star Trek
10 Serpentine
10 Centipede
10 Mountain King (short docs)
5 Computer Chess (2, price is for 1)
5 Jumpman Jr.
5 Gridrunner
5 Submarine Commander
5 Demon Attack
5 Atari Artist
5 Educational System

Books
20 Inside Atari DOS (2, price is for 1)
20 Atari Basic Source Book
20 SAMs Programmers Reference Guide for the Atari 400/800
15 The Atari Assembler
15 Hackerbook (EPROM Burner docs, DCB usage instructions)
15 Program Descriptions (for Hofacker software - EPROM burner, joystick serial port, joystick printer port)
15 Compute's Second Book of Atari (Forced Read Mode, Display List interrupts, Fun with scrolling)
15 The Musical Atari
10 Basic Exercises for the Atari
10 101 Basic Programming Tips & Tricks
10 Atari Programming with 55 programs (2, price is for 1)
5 Understanding Atari Graphics (small booklet)
5 How to use Atari Computers (small booklet)
5 The book of Atari Software 1983

20 Second Book of Machine Language
15 Machine Language for Beginners (2, price is for 1)

20 6502 applications (Rodnay Zaks - hardware programming oriented, includes info on 6520,6522,6530,6532, and MC1408 (DAC))
20 6502 assembly language subroutines (includes 6522 reference, subroutines for interrupts, multipliation, division, etc)
20 6502 Assembly Language Programming (includes info on 6520,6522,6530, 6532, 6850, and 6800 (CPU))
20 Top-Down assembly language programming for the 6502 (including Atari)

Texts
30 Original 400/800 notes (2 inches thick, includes schematic of Pokey.)
20 130XE Reference Manual
15 Atari XL Addendum

Antic Magazines ($1 unless noted otherwise)
Nov 88 (Dr. Brilliant "All about 8-bit memory upgrades),

Computer Shopper Feb 1987 (800 Memory mod by D.G. Byrd)

Atari Explorer Magazine May/June 1988 issue

Current Notes
Dec 87, Oct 87, Jul-Aug 87, Mar 87

Prices do not include shipping. Shipping costs are rounded up to the
nearest dollar. All items are for sale to the highest bidder, any offer
will be considered, but any order must be sufficient to make me want to wrap
it all up and bring it to the post office. Minimum order is $20.

Feel free to contact me through one of the following:
Home phone: (203) 567-3082
Internet: OrdaniaDM@cup.portal.com
US Mail: Chuck Hughes
239 Brush Hill Rd
Litchfield, CT 06759

My home phone is the quickest way to reach me, but I do check my email about every other day.

Here's another section of stuff that someone may be interested in, I guess you could call it the "Where'd THAT come from?" section.

MAO Apple II with monitor, cpm card, and 80 column card, AND
Applesoft basic programming reference manual, AND
Applesoft tutorial, AND
Micro on the Apple volume 2 (no diskette), AND
Apple II programmers handbook

MAO Gemini printer USER's MANUAL (not the printer)

MAO MC6809 Cookbook

MAO Commodore 64 Users Encyclopedia

MAO stands for MAKE AN OFFER. I hate throwing stuff out, but I'll do it...I swear I will... :) [If nothing else, the Apple II is worth the chips. :)]

Chuck Hughes
